Mr. Jones is very emphatic in his advice to feed whenever the bees are not getting nectar from the flowers—just a little each day to stimulate them so that breeding may go vigorously forward. I and my students proved the importance of this by repeated and most careful experiments several years ago. I have always stoutly recommended it and emphasize its importance in my "Manual of the Apiary." Mr. Jones, however, has brought out two new points in connection with feeding: 1st, If the queen stop laying once, it is far more difficult to induce her to commence again than to keep her at work by judicious feeding, before she ceases to lay. Sometimes if she is forced to idleness from the entire cessation of storing on the part of the bees, during the latter part of Summer and in Autumn, it is impossible to get her to resume at all, even if we do feed. This adds new force to the advice; "Always feed, especially in late Summer and in Autumn, when the bees are not gathering." The second point is that this persistent idleness on the part of the queen, if once commenced late in the season, is much more marked in old queens than in young ones. This furnishes another reason

for the advice which I have repeatedly given, "Keep only young, vigorous queens." To be sure, some queens show a remarkable prolificness the second and even the third year, and such queens should not only be kept, but I would breed from them; but as a rule we gain by keeping only the young queens in our apiaries.

WHEN TO EXTRACT.

I proved long ago that the waiting for the bees to cap the honey before we extract, is not only expensive, as it involves much useless labor in uncapping, but is entirely unnecessary. Mr. Jones, who has as wide an experience as any one in the country, fully agrees with me in this opinion. Messrs. Muth, certainly, and I think Messrs. Hill and Doolittle are of the same opinion. The extracted honey, of course, must not be put into a damp or a cold room as then very likely it will ferment; nor must it be kept in a tight vessel, for in such cases it has no chance to "ripen" and in the latter case it will ferment and the vessel will, very likely, be burst. But if we put the honey in a warm, dry room, in an open-mouthed can or barrel, which, to protect the honey from the dust, should be covered with a piece of factory, we may save the immense labor of uncapping, get far more honey, as the bees will do more, and may be sure of honey of the first excellence. True, Mr. Bingham and others whose judgment is justly respected, urge that unless the honey is "ripened" in the hive, it has lost some of its flavor and so is inferior. I have honey now in our College apiary that is several years old, and though very thin when it was extracted, it is now thick and heavy, and all who have tasted of it pronounce it of the best quality.

It may generally be best to wait till just as the bees commence to cap the honey, as then very little pains are required to keep honey in good condition, while all of the labor of uncapping is saved. But to secure the most honey and so the best results, we must extract every second or third day, as then the bees will gather far more. But then, we must be sure that the honey is kept for some weeks in an open vessel in a room where the temperature is constantly up to near 100° Fahr. This course is safe, economical and very profitable. But if it is adopted, we must never put the honey in tight vessels till it is thick, and never put it in a damp, cool room, which is a totally unfit place for any honey at any time. Even comb honey, all capped over, will sour in a cool, damp cellar.

PERFORATED ZINC.

Mr. Jones has found great advantage in the use of perforated zinc in his apiary. This zinc is pierced with rectangular holes which are 3-16x9-16 of an inch in size. These will permit a worker bee to pass, but not a queen or a drone. By using this at the entrance, the queen can be kept in, and so the apiarist may leave the apiary with no danger of loss from the bees swarming out, and, further, he can keep all drones in, or, if he wishes, weed them out and kill them off, and by doing this to all his undesirable colonies, and those of his near neighbors, he can select his drones as well as his queens, unless there are drones in the forests near-by. These strips are so made that the banking up of the drones does not keep the workers out. By putting them at a hive a little after noon, all the drones that are out will be kept out at night and may be killed. This is the best way, as drones eat a great deal and are expensive hangers-on in any apiary. By keeping the strips before such hives as we do not wish to breed from, we may keep the drones in and so select our drones as to males as well as females.

In a future article I will explain how Mr. Jones uses the zinc as a division-board, and gets all the honey stored in the body of the hive at a great profit.

Field Crops.

DIFFICULTIES ENCOUNTERED BY THE EXPERIMENTER.

PROFESSOR W. J. BEAL.

IN the RURAL for November 19, you quote from the report of the Illinois Industrial University the results of cultivating corn three times and six times in the row, and give the summary showing an increase of eight per cent. for the extra cultivation. In four cases the figures show something in favor of cultivating three times over cultivating six times. In one of these the difference is nearly 40 per cent. In four cases the figures show something in favor of cultivating six times in the row.

"Incog," in the RURAL for November 26, speaks of an experiment in potato planting. He plants one row of 70 hills through a piece and cuts the seed in a certain way different from that for the rest of the field. It was compared with a row next to it, and showed a surplus of over 50 per cent.

The above reminds me of an experiment made the past Summer. In the College vegetable garden, we have a piece of flat, rich ground which almost every one would call quite even for productiveness. It has been planted to onions for several years past. In September of this year I asked my assistant in experiments to select a number of rows which were as nearly alike as he could find in the piece. He should avoid ridge-furrows and bed furrows and rows which might contain vacancies. The rows were 14 inches apart, and, so far as any of us know, were treated alike. The five rows were next to each other. Beginning at one side the first yielded 6½ bushels; second, 5¾ bushels; third, 6½ bushels; fourth, 4½ bushels; fifth, five bushels. If we take any two contiguous rows alone, or if we alternate the whole number, we find a great difference in the yield. This only shows one of the difficulties in making experiments in agriculture. I will not say more. Let any one figure on the onions as he may choose.

FIG. 549.

BLOUNT'S NO. 10 SPRING WHEAT.

THIS is a cross of the Diehl, a New York Winter wheat, upon the Golden Straw, a Virginia Winter wheat, produced by Professor A. E. Blount, of the Colorado State College. It is now but three years old, and is a Spring wheat of great value, having very large, closely-formed heads, stiff straw and beautiful grain. It does not shell easily, nor does the straw fall, nor is it subject to rust in Colorado. The analysis of the grain shows it to be a strong wheat, having nearly 14 per cent. gluten. It is an enormous yielder. By cultivation the past year, and without any fertilizer, it produced over 1,800-fold. Seventy-six kernels, weighing 49 grains Troy, produced 10¼ pounds. The 76 kernels were planted one foot apart each way.

No. 10 has, as yet, received no name, not being fully standardized. Sown as a Winter wheat at the Rural Farm, we made the following notes:—"Straw heavy; heads average over four inches; eight breasts and three kernels to a breast. Cut July 16. Kernels shriveled. The heads vary in form, some more resembling the Diehl in being larger at the top, others being pointed. Promising as a Winter wheat." The portrait is from nature.

TOBACCO-GROWING NOTES.

AT the present rate of consumption there is little danger of an overstocked market of the better grades of seed-leaf tobacco. The increase in production has been very rapid, but it does not seem to be greater than the consumption. In 1845, when the variety of tobacco known as seed leaf was first grown as a marketable commodity, there were but 3,000 cases of 400 pounds each produced in all the United States. Since that time the production has increased, until in 1880, the product was 280,000 cases—an increase of from 12,000,000 to 112,000,000 pounds in 35 years.

ASSORTING tobacco is now in order and it would be well if growers of seed leaf tobacco everywhere could fully understand the importance of performing the work well. The tobacco growers of Lancaster County, Pa., have gained a world-wide celebrity for the tobacco which they produce, which is due largely to the systematic and painstaking manner in which they put up their crops. Seed leaf tobacco to suit the trade, should be assorted into from four to seven qualities, the latter number being much preferable to the former. The leaves should be selected as regards size, soundness and general quality.

IT is not only important that the assorting be done properly and each quality kept strictly by itself, but the "hands" or "hanks" should be made to present a neat appearance. Hands of wrappers should contain from twelve to fourteen leaves each and the tying should be done in a neat and careful manner, for there is no one thing which causes a crop of tobacco to appear so well as to have the "hands" of uniform size and tied in a neat, workmanlike manner.

WHEN a number of qualities are being made in assorting tobacco I have found it an excellent plan to divide up the table in which the work is done into apartments, one for each quality. This may be done by placing narrow strips of boards crosswise of the table and from eight to ten inches apart, or by placing pins of wood between the places allotted to the various qualities. This simple precaution prevents the assortments from becoming mixed on the table and also keeps the leaves in a neat, compact shape until tied into "hands."

Farm Topics.

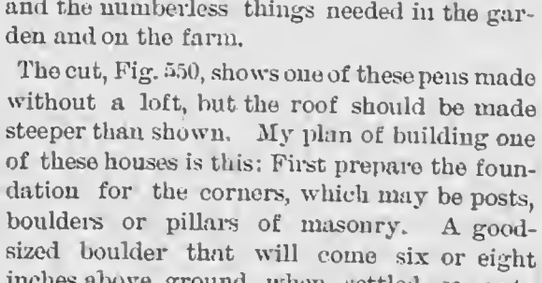
HOG HOUSES.

WALDO F. BROWN.

WHETHER few or many hogs are kept on the farm, one or more good hog houses are needed. We want them for the sows at farrowing time, to winter Fall pigs in, to confine our male hogs, to fatten small lots of hogs, as sleeping places for the store hogs in Winter and as fertilizer factories in which to make the hogs earn their board. A suitably built hog house will be found useful for all these purposes, and on any farm where hogs are kept at all it will soon pay its cost. I have made hog houses a study for more than 20 years, in which time I have examined many and have built six for myself. I believe that for economy and convenience I have a plan as nearly perfect as can be found and which combines cheapness and convenience. After trying different forms and sizes I have adopted the plan of a house eight feet wide with the roof sloping only one way, and I build it of a length to suit the number of hogs to be accommodated. If I make it more than 16 feet long I put in a permanent partition for every 16 feet, and I have movable partitions to divide it into sections of six, seven or eight feet in width.

If in building one of these pens you need a place to store corn, or loft room for any purpose, you can use longer posts and lay a floor overhead. The smallest of my hog houses is eight by twelve feet and the loft floor is five feet above the lower one, and I have put 100 bushels of corn in this loft at one time. I generally use it, however, to store seed corn, and as a kind of convenient "catch-all" to put away garden plows, seed drills, flower pots and the numberless things needed in the garden and on the farm.

The cut, Fig. 550, shows one of these pens made without a loft, but the roof should be made steeper than shown. My plan of building one of these houses is this: First prepare the foundation for the corners, which may be posts, boulders or pillars of masonry. A good-sized boulder that will come six or eight inches above ground when settled, so as to rest on the subsoil, is as good as any. Next place your sills, eight feet long, across the ends, and five joists the length of your pen from sill to sill. A sill six inches, if of oak or some other good wood, is heavy enough. If your pen is 16 feet long I would advise that you use joists two inches thick and twelve wide; but if not more than 12 feet long a width of ten or possibly eight inches will do for them. The joists should be bridged in the center. When they are in place lay the floor, and I find it cheaper and better to lay a double floor of inch boards than to use two-inch lumber.



PEN FOR HOGS.—FIG. 550.

In laying the floor the lining need not be laid close; in fact, I prefer to have cracks three or four inches wide, but take pains to lay it so that there will be good boards under the cracks of the upper boards. After the floor is laid, cut posts four inches square for the corners and set them on the floor, and for a pen such as is shown in the cut, without a loft, make the rear posts four feet long and the front ones seven. Spike a two-by-four studding flat on the top from one post to the other the length of the building. These are for plates. Put up your end rafters. Shiplap a nail tie across at each end and between the sills and end rafters put a two-by-four nail tie across in front, having the top of it at the hight you want the bottom windows—and you are ready to begin weather-boarding. You will make the end rafters stand flush with the sills, so that in boarding up and down, the bottom of the boards will be nailed to the sills, the top to the rafter and the middle to the tie. The front and rear boards will be nailed to the plate above and to the joist below. The rafters will be nailed down to the plates to prevent the building spreading. When completed, this building, although it has not a mortise or tenon, will be firm and substantial, and if hard wood is used for the frame, could be rolled down a hill without injury, for every board in it acts as a brace. In boarding a building of this size a board 14 feet long will make one cut for the front and one for the rear. Anyone that can use a square, hatchet and saw can make such a house and it will take two hands less than two days to complete one of them. The cost will vary with the cost of lumber, but it will be cheap. I have often seen a farmer get out a heavy frame of hewed timbers for a hog house and frame it together strong enough for an 80-foot barn, and his frame alone would cost as much or more than this house will complete. The following is the bill of lumber for a house eight by sixteen feet.

2 sills 6 inches square, 8 feet long	72	ft.
5 joists 2x12 in. and 6 feet long	160	
10 rafters 2x4 in. and 10 feet long	70	
Siding	336	
Floor	256	
Posts, plates and nail ties	80	
Sheathing	150	
Total	1,124	ft.

It would take about 1,000 shingles and not far from one dollar's worth of nails. No hog house is complete, neither can hogs be kept clean and comfortable in it without a floored yard attached to it, and this floor should be 12 to 18 inches lower than the other. If you let them out on the ground they will, in wet weather, make a slough hole which will emit foul odors and become a standing abomination but if your yard is floored so that they cannot get at the ground and you will supply them with straw, corn stalks, sawdust, sorgo bagasse, or any good absorbent, they will make a large amount of excellent manure and the pen will never become offensive. The floor on which you feed should be cleansed every day or two, and it is well to give the hogs each day a bundle of fodder, oats or clover hay for bulky food and to keep them employed. I think that where there is material to be had to keep the hogs employed they will make manure enough to pay for such a house in a few years. As these houses are used most in Winter, I prefer to make them front the south so that the sun will shine in and warm them. I think I have described this house so plainly that anyone can build it. If more than one is wanted they can be built connected in a line, with doors communicating one with another. At one end of the pen there should be an arrangement for loading the hogs into a wagon, a door so arranged that the wag on can be backed up to it and a chute with railing at the sides so that the hogs can be driven into the wagon-bed.

Butler Co,, Ohio.

The Vineyard.

THE IONA GRAPE.

S. B. PECK.

PROBABLY no grape was ever disseminated with more *eclat* than this, nor has any one with the history of which I have been conversant, created more disappointment. Some of the reasons for this disappointment I shall attempt herein to give—and, first, the claims set up for it were extravagant as well as the prices asked for it. It was never well adapted to general field culture, being too tender and too uncertain about bearing. It only bears fair crops in special local climates, special soils, and under special treatment. It partakes too much of the fitfulness of its immediate progenitor, the Diana, and does not possess the hardiness of its grandparent the Catawba. It is true that occasionally under ordinary treatment it will bear a tremendous crop, but then it will be sure not to ripen perfectly. This shortcoming it takes honestly from the Diana. The advice an experimenter gave to his neighbor was appropriate, "If you are not a good nurse you had better let it alone." When all things are right with it, it will yield a fruit in no way inferior to the claims set up for it by its originator and his coadjutors, and any man who does not admire its appearance and its flavor, may be set down as possessing no taste for beauty, or as having a depraved palate.

The causes of failure have generally been

from expecting too much; sometimes from giving it too strong a soil, too much manure, not protecting it in Winter and al lowing it to bear too much fruit. On all these points it is very sensitive. I speak from the standpoint of the Michigan Fruit Belt, the eastern shore of Lake Michigan, in the latitude of Milwaukee and where the Catawba never ripens, the Isabella and Diana seldom, but where the Delaware, Concord, Clinton, some of Rogers's and Eumelan prosper—soil a lightish sand but evidently abounding in potash and lime. I should advice to pruno early in the Fall, lay the vines down as flat as possible, lay a light covering of brush over them (I use branches of asparagus), and lay pieces of wood as weights to keep all in their places. I do not believe in covering with earth. The two past Winters mine have been left on the trellises. In the Fall of 1880 I had a big crop but they were not well colored. The crop of 1881 was small, many of the canes were killed down, but the few I had were perfect, so much so that on the twelfth of September I sent a sample, with samples of nine other kinds, to the meeting of the American Pomological Society at Boston, which exhibition is said to have done high credit to our State.

A word, in passing, as to the Israella, a contemporary of the Iona: With all the care I could ever give it I could never induce it to bear a decent crop. Like the Dutchman's horse, it has one bad fault—it is "good for nothing." It has the peculiarities of the Iona as to habitat, etc., "only more so."

The differences in reports coming from different persons showing different results from experiments on the same fruits, are probably mostly the effects of local causes. There are so many different plans used in pruning and training, and even in planting and cultivating; all possibly have their effects for good or ill, and so many that are hardly practicable without daily watching through the Summer, that one gets discouraged and perhaps disgusted with his own efforts to steer clear of mistakes and failures. If he finally gives up and relies solely on his own experience and judgment, he is as likely to be successful as those who follow set rules. It is most certain, however, that there are natural tendencies of the vines that must be in a measure indulged, and certain others that must be curbed in order to produce the best results.

Muskegon Co., Mich.

Scientific.

"OZONE" AS A PRESERVATIVE FOR MEATS, VEGETABLES, ETC.

PROFESSOR R. B. WARDER.

A COMPANY has recently been organized, with headquarters in Cincinnati, which announces the use of "ozone" for preserving all perishable articles, animal and vegetable, from fermentation and putrefaction, retaining their odor and flavor. The process appears to be simple and inexpensive. The articles are placed in an air-tight chamber and a small quantity of the "ozone-generator" is burned, by which the active gas is produced. Samples of mutton, eggs, apples and vegetables are exhibited, said to have been kept some two or three months already, without undergoing any marked change; but juicy fruits and vegetables are sometimes kept under "ozonized water" to prevent drying up. The agents of the company politely invite those who show an interest in the new (?) process to test it by bringing in such articles as they may wish to have "preserved" free of charge; and we may not blame them for not keeping a lunch always ready in proof of their claims of unchanged flavor.

To the practical fruit-grower or shipper the chemistry and histology of a preservative process may seem to be of little importance. Yet if a process is proved to be totally different from what is claimed, he should invest with caution: if it is old instead of new, he may save himself the expense of a costly patent right; and if the materials are known, he may purchase them at market price, instead of putting large profits into the hands of a limited company.

For these reasons, the writer has taken pains to examine a sample of the "ozonized water," which is a partly saturated solution of sulphurous acid. When sulphur is burned, the suffocating gas called sulphurous oxide is produced, which is very readily absorbed by water, forming sulphurous acid; and this is evidently an essential part of the process of making the "ozonized water." Sulphurous oxide is diametrically opposite to ozone in its chemical properties, the former being a reducing agent, the latter an oxidizing agent. Moreover, ozone is practically insoluble in water. Whatever else may have been present in the so-called "ozonized water," ozone is evidently absent. Fuller chemical papers on this subject may appear in scientific journals; but in the meantime any would-be investors who have been attracted by the glowing language of the circulars, are invited to consider the following facts: 1st. In the so-called ozone process, the fumes of burning sulphur are the active agent, rather than ozone. 2nd. Sulphurous oxide has already been used as an antiseptic for many years. 3rd. The use of fumes from burning sulphur is said to have been patented as early as 1868; the validity of any more recent patent claim for like process may well be questioned. 4th Those who have invested $2.00 in a sample package of the "ozone generator" in order to test the claims of a "new" process, will find it instructive to make a counter test with two cents' worth of sulphur.

Floricultural.

THE YAMABUKI--Rhodotypus kerrioides

[See page 829.]

THIS is a beautiful, hardy, deciduous, white-flowering shrub from Japan; the Japanese call it Yamabuki. It is of recent introduction to America, and still quite rare in our gardens and nurserymen's catalogues. It belongs to the rose order of plants and is nearly allied to the kerria, a Japanese shrub with yellow flowers, that is very common in our gardens. With us it comes into bloom in May, about the same time as kerria, hawthorn, bush honeysuckles and choke berry, and lasts for more than a month in good flowering condition. The pure white flowers are large, pretty and of good substance, and nestling closely to the leaves, as represented in the accompanying illustration, terminate every little twig. The Yamabuki is not so profuse as spiræas, deutzias or diervillas, but it is profuse enough, when coupled with its graceful habit, to be really pretty. Furthermore, not only does it bloom in the Spring and early Summer, but a few straggling flowers may be found upon it all Summer long. And somewhat ornamental is the multitude of glossy black "seeds" it bears. Many of these drop off towards Fall, but a lot of them stay on the bushes till Christmas, and we find some young plants—self-sown seedlings—are springing up around our parent plant. The Yamabuki is perfectly hardy with us. A warm, free soil, and sheltered, sunny situation, no doubt, will suit it best. The engraving, Fig. 548, is from a specimen growing at the Rural Experiment Grounds, where, on November 21, the leaves were still green.

Miscellaneous.

CATALOGUES, ETC.

JOURNAL OF THE AMERICAN AGRICULTURAL ASSOCIATION.—Nos. 3 and 4 combined in one, the last of Vol. 1st of the American Ag. Association, is now before us. As we shall have occasion to quote from its columns, we need only add, to what has already been said of it, that a copy should be in the hands of all who are interested in agriculture. It will hereafter be published quarterly (January, April, July and October), under the name of the Agricultural Quarterly and Journal of the American Agricultural Association. Each number will contain 150 to 200 pages. The terms will be $2.00 per year and, after January 1st, 50 cents per copy. Three dollars sent now will pay the annual dues for this year and next and entitle the new member to all the issues of the Journal for both years. Inquiries should be addressed to the Secretary and Editor, Joseph H. Reall, 127 Water Street, New York. The present Journal comprises 300 pages, 230 being filled with excellent articles by able writers, 30 with the thoughtful notes of the editor, and the rest with advertisements.

RURAL BRIEFLETS.

MR. A. M. PURDY writes us that if we pronounce the Lost Rubies Raspberry distinct from Naomi, he is confident we have not the real Naomi. That may be. Our statement is that if we have the true Naomi and the true Lost Rubies, then they are distinct, for the one has purple, the other green, canes.....

THIS we have from Secretary Garfield:—"I am now 'digging away' at my portfolio for 1881. Well, I must say this about your Tree and Shrub Number, and hope it won't 'set you up' any. *I just wanted to place the whole of it in my volume for '81. It was a rare number, indeed.* Over here in Michigan the 'commercial idea' is uppermost in the minds of the people, and I like to have that kind of a paper thrown in among them to lead them for a few moments to a higher plane of thought."....

AS EFFECTUAL a way as any to preserve gladiolus corms or bulbs is to keep them in bushel baskets in a temperature above freezing and less than 50 degrees. As to tuberose bulbs we have never yet known them to suffer by being kept too warm or dry. Canna and caladium bulbs should be thoroughly cleaned and dried and placed in dry sand and preserved in a dry air.....

IF we were going to plant a vineyard either for home use or market, we should not select the Concord with which to stock it. With many kinds of fruit very little real progress has been made during the past 10 years, though scores of new varieties have been announced from time to time as far superior to the old. Not so with the grape. Our progress has been real, and two or three years more will make it apparent. It is probable that we shall never have a grape that is at once more hardy, more prolific and adapted to a greater range of country than the Concord. But we believe among the grapes of recent origin are several that will equal it in those essential respects, while they are of decidedly better quality....

E. & O. Ward, New York commission merchants, tell us that to insure highest market prices for poultry they must be well fattened, the crops empty when killed. They should be killed by bleeding, but the head should not be removed. They should be well picked; the skin not broken or torn; the entrails should not be removed; they should be thoroughly cooled, but not frozen. Pack in boxes, with a layer of clean straw (rye straw being the best) between each layer of poultry, in the same posture in which they roost. Mark each box, specifying what it contains. Send the invoice by mail. Ship to reach their destination about the middle of the week. They should never reach market so late in the week as on Saturday.....

THE vigor of strawberry plants can perhaps be as well ascertained by their appearance now as at any other season of the year. Plants which cannot stand the Summer sun, or which have been injured by the grubs, are dry and brown, while those which have outgrown all harmful effects are green and thrifty. Of these the Manchester, Piper's Seedling, Sucker State, Hart's Minnesota, Sharpless, Duncan, Miner's Prolific and Bidwell are the most conspicuous.....

WE are pleased to know that the Home-Farm, of Maine, is an assured success. Maine has long needed a bright, original agricultural paper, edited by one who is in full sympathy with the farming community, and it now has such a journal in the Home-Farm.....

OUR friend "Edgerton" sends the RURAL the following:—

Said farmer Brown, as to his wife he turned,
"Each season brings its lesson to be learned.
The last we had it most exceeding dry,
And now we find corn rules outrageous high;
Now, if we only had the corn to sell,
This state of things might all be well,
But, somehow, when a product's awful high,
It mostly happens that we have to buy.
And this is why no money we have made—
Our plans have always been but poorly laid.
Now I'll lay down a rule this very morn,
That when the season's dry *raise stacks of corn*,
And so with almost any other truck—
We'll make a note of this and change our luck—
When any article is scarce and high
We want that article to sell, not buy.
How strange we never thought of this before!
No wonder we have always kept so poor!
Our knowledge we too often dearly earn;
But then, you know, we have to live and learn."

THE answer to the query as to which is the sweetest or highest flavored strawberry seems to have been mixed. To say that a berry "has sweetness and flavor" and is at the same time "simply flat" sounds odd enough. The true Burr's New Pine is remarkable for its delicious, *spicy* flavor and at the same time is sweet—much like a Seckel Pear. The mistake was made evidently by a transposition of the type lines.....

To the very many inquiries we have had as to where seeds of the Rural Branching Sorghum can be purchased for next season's use, we must reply that we do not know. The crop raised from the seed sent out in the RURAL'S last seed distribution has in many sections of the country matured seed—but the quantities so raised must necessarily be small—too small to offer for sale except at a very high price. We are fearful that inferior kinds of Sorghum will be offered under the name of Branching, so that for the present, it would seem desirable that the name of the "Rural Branching Sorghum" should be preserved. We have received several fine heads of seeds from California, Kansas, Florida, Nebraska, New York and Minnesota.....

IT is with much satisfaction that we announce the publication of a series of original illustrated articles on "Bonanza Farming." Mr. Oliver Dalrymple is an exceedingly retiring, modest man and has refused many applications for his portrait (as we happen to know) from the enterprising journals both East and West that have endeavored to procure it. The articles are written from notes taken on the ground and furnished by Mr. Dalrymple himself.....

DR. J. B. LAWES in a private note remarks: "I shall think you find some difference in your crops of corn this year as compared with those of last. Climate has a most decided influence upon the yield of our crops and it is this varying influence which makes it so difficult to settle what is the real influence of our various manures. I know of no other process to settle these questions except by the continued growth of the same crops with the same manures upon the same land."....

THE results of our corn experiments will be presented early in the new year. We have only to say now that, considering the drought—the severest, without exception, known to our oldest farmers—our yields of corn both on the manured and unmanured land, have proved to be greater than was anticipated. Concentrated fertilizers on high lands, were used without good effects, while the corn manured with farm dung was the first to burn.....

What Others Say.

THE EXPERIMENT FARM OF THE "RURAL NEW-YORKER."

[FROM the Journal of the American Agricultural Association, just published, we copy the following article, which, though the gist of it in different language may have appeared in our columns under Notes from the Rural Farm, we feel confident will prove of interest to our readers.—EDS. RURAL NEW-YORKER.]

SPECIAL WHEAT AND CORN CULTURE.

The farm of the RURAL NEW-YORKER is situated in Queens County, 20 miles from New York City, near the ocean. The soil is a sandy, sometimes gravelly, loam, with a gravelly sub-soil. The farm is conducted for the purpose of testing all new plants or seeds of promise which are offered to the public, the results being published as soon as arrived at; of originating new varieties: of improving old varieties by selection; of ascertaining the best methods of cultivation; and, finally, of comparing the effects of farm manure with those of concentrated fertilizers.

We propose at present to confine our remarks to corn and wheat. Twelve years ago Mr. A. E. Blount, now Professor of Agriculture in the State College of Colorado, began the improvement of a kind of white dent corn, with the special object of rendering it as prolific as possible. The land was well prepared and manured; the best ears only, from those stalks which bore two or more, were selected for seed, preference being always given to the topmost ear, which he usually found to be the best developed. By such means, and by others to which we shall allude further on, this strain of corn, as it may be termed, was changed, so as to ripen earlier, to bear a greater number of ears to the stalk, while the cob was made smaller and the grain of uniform size and color. Four years ago it was first raised on the Rural Farm. A plot of a quarter of an acre was planted, the grains 14 inches apart, the rows four feet, the cultivation *flat*. The yield was 18 bushels of shelled corn, or at the rate of 72 bushels to the acre. Several stalks bore six ears. The best of these were selected for the next year's seed-plot, while Prof. Blount's entire stock was purchased for free distribution to all who applied to the RURAL NEW-YORKER. What is meant by seed-plot may now be explained. A plot of land—perhaps one-fortieth of an acre—(33 feet square)—is spaded up, fertilized and raked. Rejecting the butts and tips of the best ears of the stalks bearing five ears or more, as above stated, the largest kernels left are planted 18 inches apart, the rows not less than four feet apart. The surface is kept mellow by shallow, flat cultivation, and, as soon as the sets appear, the tassels of all stalks not bearing a certain number—let us say *five*—are cut off. It will appear then that the silk of all the sets must receive pollen only from the most prolific stalks. The corn plant is monœcious (the same as the chestnut, alder, pine, spruce, castor-oil plant, melon), the male organs, or staminate, being contained within the flowers of the tassel, the female being the silk or pistils of which the fertilized ovary becomes the kernel or grain. It is plain, therefore, that if we desire to increase the number of ears to the stalk, it is just as essential that the seed to be planted should have had a fertile male as that it should have had a fertile female parent. When it is considered that all the varieties of corn—flint, dent, gourd-seed, pop—whether black, white, red, yellow, streaked—whether the plant grow two or fifteen feet in hight—whether it requires 60 or 160 days to mature—have all sprung from one kind, it will be seen how sensitive this plant and its fruit are to changes of climate and soil, and how respon-

sive to careful selection and breeding. Thus it has occurred that 134 bushels of shelled Blount's corn were produced on one acre of land at the Rural Farm during last year (1880), though no doubt this great yield was due to other causes as well. Of this the reader may himself judge. The facts are very briefly as follows:

The field had received no farm manure in seven years. It had been mown and in pasture during that time. The sod was plowed under in early Winter, and in the Spring was thoroughly harrowed, rolled and harrowed. The corn was drilled in 12 to 15 inches apart, the drills 4 feet 3 inches apart. One dressing of concentrated corn fertilizer, at the rate of 300 pounds to the acre, was given previous to the last harrowing. When the corn was several inches high it received another application of the same fertilizer, at the rate of 100 pounds per acre, and when 18 inches to two feet high another of 100 pounds of concentrated potato manure. The field was cultivated four times—twice with a cultivator that penetrated the soil scarcely two inches in depth, twice with a hoe, always flat, all hilling up whatever being carefully avoided.

The promise of a remarkable yield upon this field, as well as upon another, was so apparent before the corn was ripe, that it was deemed advisable to have it examined and measured by well-known persons, who could have no interest in misrepresenting the yield in any way. Accordingly, it was examined by no less than twelve gentlemen, all in one way or another prominently connected with agriculture. The following report is all tha need here be presented:

"Report on a field of corn near Hewlett's Station, Long Island, belonging to the RURAL NEW-YORKER, made October 12th, 1880.—Size of plot, 310 by 122.4 feet, or .87 of an acre of corn (Blount's White Prolific), sown by machine in rows 4 feet 3 inches apart, and each single kernel intended to be 15 inches from its neighbors; flat culture.—[Details as expressed above, here made in the report, need not be repeated.] From a judicious selection of stooks and careful measurement and weighing, we find the total yield was 227 bushel baskets of corn on the cob, or 261 bushels upon an acre. We also shelled and weighed a quantity, and ascertained the gross weight of three and seven-eighths bushels to be 136 pounds, or 35.1 to one bushel, and further, that 35 pounds of corn in the ear gave 28.95 pounds of grains and 6.05 of cob, and measured 17.1 quarts. This calculation showed that the equivalent of 261 bushels of corn on the cob was 139.4 bushels of grains, and about three bushels, or a little more, which Mr. Carman had selected from the most prolific stalks, and had already placed in the barn, or a grand total of about 142 bushels of shelled corn per acre. (Signed)

Pres. Farmers' Club, American Institute.
W. N. HABERSHAW, F. C. S.,
Chemist N. Y. State Ag. Society.
L. C. BENEDICT,
Ag. Ed. N. Y. World.

Husked not until some time afterwards, and measured as cribbed, the yield proved to be, as previously stated, 134 bushels per acre, or eight bushels less than the above estimate.

Upon an adjacent field of somewhat over four acres, a variety of yellow dent called the Chester County Mammoth was raised, the best acre of which yielded 150 bushels of shelled corn, while the entire field, though a portion was poorly drained, yielded 112 bushels to the acre. The soil of this field has always been considered the poorest of the farm, being gravelly and dry. It had received no manure of any kind in over twelve years. It was treated the same in all other respects as that upon which the Blount was grown, except that but 350 pounds of concentrated corn manure were sown before the last harrowing, and the seed was drilled in the rows 3 feet 10 inches apart.

As it was evident that these yields, which have never before been equaled upon considerable areas under inexpensive manuring and cultivation, could not alone have been due either to naturally rich land or to the liberal application of manures of any kind, the varieties of corn, the peculiar methods of planting and cultivating, must also be considered. To test these points has been made the object of an experiment field the present season. It contains about five acres, and has received no manure in at least eight years. The soil, as nearly as may be judged by the eye, is quite similar to that upon which the Chester corn was raised last year. The sod, a very poor one where it existed at all, was plowed under late in March. The soil was then repeatedly harrowed until it had become as mellow as that of a garden plot. The seed was drilled in, May 12 and 13, the rows 3 feet 10 inches apart. Except upon special plots no manure of any kind was used. Upon the middle portion, as that was thought to be a fair average of the soil of the entire field, one measured acre (132 by 330 feet) received 600 pounds of corn fertilizer previous to the last harrowing. In order to provide against sowing this fertilizer outside of the acre, a string was stretched about it and the fertilizer extended with damp earth until all dusty or dry portions were fixed. Now the difference in yield between this acre and the unmanured parts will not only tend to determine whether the commercial fertilizer pays for itself, but it should throw light upon the question to what extent the immense yields of last year were due to the commercial fertilizers then used.

Another series of experiments conducted on this field is the testing of special fertilizers upon plots of a twentieth of an acre. For example: No. 1 received 7½ pounds of nitrate of soda; No. 2, 35 pounds of phosphoric acid; No. 3, 7½ pounds muriate of potash; No. 4, nitrate of soda and dissolved bone-black combined; No. 5, nitrate of soda and muriate of potash; No. 6, bone-black and potash; No. 7, all combined; No. 8, sulphate of lime. The object of this experiment, which many others are also carrying on, is simply to determine what manurial constituent the land most needs. But Mr. Carman is of the opinion that such tests will, as a rule, prove little upon such small plots, and that even upon larger plots the same experiments should be carried on for a number of years.

RHODOTYPUS KERRIOIDES—FROM LIFE.—FIG. 548.

Several objections have been made to the Rural's methods of drilling in corn seed and flat cultivation. One is that the plant is more liable to fall under high wind. This is not admitted. It is true of the young plant before its roots have extended much; but young plants always right themselves, so that the objection can only apply to older plants. Both the Blount and Chester Co. Mammoth are tall-growing varieties, the former averaging eleven feet when fully grown, the latter over nine, which is considerably taller than the kinds cultivated by the neighboring farmers. Nevertheless, the Rural corn has stood high winds fully as well as theirs. It should be considered that the lateral roots of corn extend, late in the season, well across the rows, and, in hilling up, the soil is taken from the extended roots, where it is most needed, to heap about the stems, where it is less needed. Thus the weight, so to speak, is taken from the long lever and placed upon the short lever. Again, in plowing to hill up, some of the lateral roots are severed, and the plant is thus deprived of their support entirely.

Another objection made to flat cultivation is, that neither the cultivator nor plow can be run but one way, and that consequently the narrow belt upon which the plants grow *must* be hoed or the weeds suffered to grow. This objection is a valid one. Still, if the rows are straight, the cultivator may be run so near to the plants that very little hoeing is really necessary. This is the only objection to drill rows, that has been discovered, while, for the rest, it seems evident that corn planted one foot apart in the drill will thrive better and bear more grain than when three or four plants are crowded together, as in the old check or hill system. Root-pruning, that is, plowing corn after it has grown to any size, is very decidedly objected to at the Rural Farm. It is contended that the corn plant cannot have too many roots, and that they should be permitted to branch out in every direction, as nature intended they should. The fact that fruit trees growing too luxuriantly may be brought to fruitfulness by root-pruning does not here apply. The one is a perennial, the other an annual. One bears fruit for many years, the other but once. It is admitted that large crops of Indian corn have been raised though deep-plowing were practiced. But the question is asked, if those crops might not have been greater had the land been cultivated near the surface only? These experiments, now carried on for the third year at the Rural Farm, must the present season determine in a measure the relative value of the above peculiar methods as compared with the old. On every side of the Rural Farm are thrifty farmers. Their fields are well tilled and manured. And yet they have never equaled the above yields, produced with no farm, and but a small quantity of commercial, manure. If, now, an old field that has not been manured for eight years at least, can be made, under *any* otherwise economical system of planting and culture, to produce more grain than neighboring fields which have been richly manured, it must speak well for the methods which effect that result.

Many observations have been made during the past three years to ascertain whether the silk of a given stalk is, or may be, pollenated and the ovules fertilized by the pollen of the tassel of the *same* plant. The conclusion arrived at is that some ears are *never* so fertilized, the pollen ripening before the silk (pistil) is ripe. This is the case with many kinds of field corn, notably with that of Blount's White Prolific. In this variety, it sometimes happens that the pollen of a given stalk is shed before even the *sets* appear. It has been stated within the past year, by those who should know, that all kinds of Indian corn are proteraudrous. But Mr. Carman has pointed out that this is not so, and has shown that in many kinds (many of the sweet corns, for example) the silk is receptive at the same time that the pollen is mature.

WHEATS.

There were not less than 80 different varieties of wheat grown at the Rural Farm the past season. Most of these were new kinds, not yet offered for sale by seedsmen, many of them originating at the Rural Farm, through selection, through the changing of Spring into Winter varieties, and by crossing. While great and successful efforts have been made to improve our ornamental plants, as well as those cultivated for fruit, is it not surprising that the wheat plant, which stands foremost among the agricultural crops of this country—of the world, indeed—should have been so neglected?

Those visiting the farm express surprise that they should see so many different kinds of wheat, all apparently thriving, and many of them bearing heads and kernels of a size to which they had deemed wheats could never attain in the soil and climate of Long Island. True, they may not thrive elsewhere as well as there. Only a comprehensive test could determine this, and it will require several years ere these wheats can be distributed for this purpose. As wheats cannot inter-cross by natural agencies, their generative organs being confined within close-fitting envelopes, the origin of many new varieties of wheats, could it be known, would, no doubt, prove highly interesting.

* * * * * *

CROSSING WHEATS.

The many different varieties of wheat raised at the Rural Farm the past season gave excellent facilities for crossing. Where few kinds are raised, the selection of both parents is, of course, restricted, and it is often impossible to obtain pollen when needed. Crossing wheats, even to those who are skilled in crossing flowers in general, is a delicate operation, and requires both a steady hand and a fair share of patience. The outer husk, chaff or covering (botanically *glume*) may be compared to the calyx in other flowers. Within this husk are two other husks (botanically pales, palets or paleæ), which may be compared to the corolla or petals of other flowers. Between these palets, the first of which is awned in the bearded kinds and in the beardless kinds merely pointed, are the stamens and pistil. In crossing different kinds, the two pales which rest close together must, of course, be separated, so that the three stamens may be removed and others inserted in their place—stamens (anthers) from the kind with which it is desired to effect a cross. After the stamens of the head to be fertilized have been removed, which is easily effected by the use of a sharp-pointed stick, and other anthers introduced, it is best to wind a worsted yarn about the spikelets to hold the glumes and palets together, and so exclude the pollen from other flowers. The anthers should be selected when of a golden color, just before they are ready to burst. If used earlier the anther will dry up and the pollen become impotent.

The inner kernels of wheat spikelets are always smaller than the outer ones, and they are later in ripening. In establishing any new variety of wheat, therefore, by cross-breeding, the outer flowers should alone be operated upon, and the outer kernels alone be saved for seed. A breast and spikelet of wheat have the same signification, the first being the familiar name, the second the botanical name, of one of the sets in which a wheat-head is separated. Some breasts bear three, some five, flowers. In the three-flowered, the middle is generally abortive, as in the noted Clawson, which usually bears but two kernels in a breast or spikelet. In five-flowered, two are usually abortive, so that the breast bears but three kernels. Such differences, which seem never before to have been considered, make a great difference in the yield, and farmers should, by selection, endeavor to establish and to cultivate those varieties which bear three or four grains in a breast. It is urged, indeed, that in all seedsmen's catalogues the descriptions of wheats should state how many grains there are to a breast. Whether it contains two or three grains, all else being equal, makes a difference of one-third in the yield.

Most farmers are careful to shell off the butts and tips of seed corn. They should be just as careful in the selection of seed wheat to reject all but the outer seeds of every spikelet, and to cut off the "tip" and the "butt," so to speak, of the wheat ear. Those breasts that are just about the middle of the ear or head, or a little above, are the first to bloom, the first to ripen their grains. It is very evident that saving seed in this way in quantity would be absurd. But the RURAL advocates SEED PLOTS just the same for wheat as for corn. For this purpose plots 33x33 feet (one-fortieth of an acre) are plenty large enough. The seed, carefully selected from the largest, heaviest heads, while yet standing in the field—the butts and tips cut off with a pair of scissors—are *planted* a foot or less apart each way. This plot is cultivated once in the Fall, again in the Spring. So planted, only a little over 1,000 seeds are required, and these are furnished by about 75 heads. If an acre be be laid off in ten-inch squares, it will require about 67,500 grains to plant it. Now, if we suppose that each grain produces 20 heads (which is not excessive for grain so sowed or planted), and every head 20 grains, allowlowing 600,000 grains to the bushel, we have a crop of 45 bushels to the acre. The yield of these cultivated plots is, in most seasons, surprising, and the straws and heads are fully double the usual size. If we were to suppose that seed wheat yields but thirty-fold, one bushel of seed should produce 30 bushels of crop. But every seed produces, by tillering, more than one head, and every head will produce at the least estimate 20 grains. When, therefore, two or three bushels are sown to the acre, we may see what an immense waste of seed there is. When wheat is planted as above described, one grain every foot, it is found that nearly every grain germinates, and the plants so tiller as to cover the ground by mid-spring. In the usual methods of sowing wheat, either broadcast or by drilling, it has been found that for the soil of the Rural Farm not less than 1½ bushel will produce the best yield. As, however, the land is rich and well prepared, a less quantity should serve, and the same may be said of oats, rye, barley or corn.

RURAL SPECIAL REPORTS.

Canada.

UPLANDS, Township of Machas, Ontario, Canada.—Circumstanees having taken me from home the greater part of the past Summer, I have not been able to give to the cultivation of the Rural seeds the attention they deserved. The Rural Branching Sorghum I unfortunately planted too early for this latitude; it came up well, however, but was badly cut down by frost on the 6th of June. It recovered, however, and made fully as vigorous a growth as corn planted at the same time, making from three to four feet in hight, branching well all ro nd. My cow appeared to relish it very much, preferring it to corn. I think it would make a valuable fodder plant, and I would like to-try it again if I can get some seed. The Washington Oats grew well, but smutted badly. Both varieties of asparagus grew well, and I have some fine plants, and hope in due time to make some fiue beds of this valuable vegetable. My wife, who is very fond of flowers, is especially pleased with the picotee and carnation plants. The dianthus have been much admired; in fact, they, with her other flowers, have called forth the remark from more than one that the surroundings of our shanty hore in the forest were more like those of a suburbau city residenco, making them almost forget they were n the bush. R. C.

Indiana.

REMINGTON, Jasper Co., Nov. 21.—The Rural Branching Sorghum is a valuable acquisition to farmers as a fodder plant. It was planted May 21, on rich Blue Grass sod, about in the same manner as corn, three to four seeds in a hill. It all grew nicely and branched out so as to completely cover the ground when five feet high. I cut some in August but it did not make much growth after cutting, the weather being so very hot and dry at the time that it did not head out until very late. Still most of it ripened so that I shall have seed to spare. The Washington Oats I sowed April 21. They grew rank and stood up well, there was some smut and hens got in and damaged them badly. The White Elephant was a total failure. Only a few of the asparagus seed grew. The pinks were nothing extra. We have had a terribly hot, dry season. Corn was hurt by chinch bugs and dry weather; average 30 bushels per acre. Oats were hurt by the army-worm. Prices of produce are about as follows: Wheat, not much of it raised, $1.35 per bushel; rye, $1; corn, 50c; oats, 38c; buckwheat, $1; potatoes, $1.40; hogs, live weight, $5.50; butter, 25c; eggs, 25c; hay, $8 per ton. N. S.

ROANOKE, Huntingdon Co., Nov. 23.—We have rain here three to five days out of the week; roads very bad. Corn a fair crop—was shortened by Summer drought, and the wet has injured it somewhat. Potatoes a very light crop. Wheat is looking well, though the fly has damaged some fields and it is feared will do more harm in the Spring. The Rural Branching Sorghum ripened seed. I did not cut it; it grew six or seven feet high. Stock eat it well, but no better than Early Amber cane. The White Elephant did well for the season; we got about half a bushel from a very small potato with 18 eyes. The Washington Oats were late and rusted badly. Corn brings 60@65c.; eggs and butter, 20@25c.; potatoes, $1; wheat, $1.25@1.30. A. C. H.

Iowa.

HANSEL, Franklin Co., Nov. 21.—We have had a great deal of rain the last two months, and grain is badly damaged; but now we are having a cold spell. The ground is frozen hard and the roads which were almost impassable with mud are now very rough and traveling is quite bad. Crops are very good and prices for almost everything are quite fair, but farmers cannot get them to market on account of the condition of the roads. We like the RURAL well and the Agricultural News we prize very highly and also the seed and plant distribution. The White Elephant produced 33½ pounds of nice tubers. The asparagus has done nicely, and the flower seeds also. The Washington Oats rusted and smutted very badly—no seed saved. We did not plant the Branching Sorghum but intend to do so next year. W. F.

Nebraska.

ST. JAMES, Cedar Co ,Nov. 22—The Branching Sorghum was planted on a hillside and as the weather and the ground were extraordinarily dry it didn't amount to anything. In view of the dry weather the Washington Oats did first-rate. I got two pounds of clean seed. I like them well. Owing to the miscarriage of the first White Elephant Potato sent to me, I didn't get the second until June 8, and it was planted that day, cut to 15 pieces with an eye in each. There was just one row set 12 inches apart. It was cultivated with the hoe—soil a deep, rich, black loam. On Oct. 4, I dug 13 pounds of tubers, one of which weighed one pound. I think this variety will do well in this country. The flower seeds were planted in the same sort of soil as the potato. The pinks grew finely and of them we had a big bed with blossoms of over 40 different colors. The asparagus grew first-rate and I have nice beds of both kinds Both the potatoes and pinks got diplomas at our county fair. Indeed we got about 30 premiums at that fair, having exhibited 30 different kinds of flowers, fruits, vegetables, etc. The weather was very wet during the fair and our Agricultural Society came out about $200 behind. Our president "flew the track" and hired a brass band, and had a dancing hall on the fair gronnds. The money for the hire of the band and hall, and the premiums for horse running would have brought the society out all right, if used to promote the agricultural part of the show. J. N. S.

New York.

GLENVILLE, Schenectady Co., Nov. 25.—The past season has been very hot and dry, but it has generally been good for farmers. My White Elephant Potato was very small; I planted it in six hills and dug 10 pounds of very fine tubers. I think the quality No. 1; the yield was light on account of the drought. The Washington Oats grew very finely and I harvested 10 pounds of very nice grain. Too far north for Rural Branching Sorghum; I like sweet corn better for feed. Crops in my section were a good average. Farmers sowed a good acreage of wheat, which yielded from 20 to 30 bushels per acre the last season. Prices are good for all farm produce: Wheat, $1.25; corn, 75c.; oats, 48c.; rye, $1.05; potatoes, $2 per barrel; hay, $15 per ton; butter, 27c. per pound; pork, $8 per 100. J. H. C.

FLUVANNA, Chautauqua Co., Nov. 21.—The harvest is over and everything secure; crops have been an average except potatoes and corn. The hay crop was more than an average. Wheat, oats, barley, peas and buckwheat all good—fairly up to the yield of former years. The Washington Oats were sown in a drill 22 rods long and produced 15½ pounds of grain of fine quality. I have carefully labeled them for seed for the Spring of 1882. The weather has been fine for Fall harvesting. Winter wheat, though sown late, looks fully as promising as in previous years. Pastures and aftermath are more than usually good at this season. Hay is worth $14; oats, 50c.; corn, 70c.; butter, 28@30c.; pork, 8c.; beef, 6c.; milch cows, $25@35. There is in this county a lack of Jersey and Holstein cattle—only one herd of the latter. I am of the opinion that we may improve the milking quality of our cows by crossing with the Jerseys. Many farmers think there is nothing equal to Short-horns for milk and butter. I have failed to find those equal to the grades. I should be glad to hear from my old patrons—former subscribers to the RURAL—and will supply them as promptly as in former years. I should be glad to hear from those receiving the buckwheat as premiums what the result was. H. A. WHITTEMORE.

ONEIDA, Madison Co., Nov. 21.—The asparagus of both kinds did very finely. The Rural Branching Sorghum came up well and nearly all ripened. I have more seed than I shall sow next year. The White Elephant Potato was nearly a failure on account of the dry weather. The Washington Oats did very well. The pinks are the finest we have of several kinds. I have a very fine lot of seedling potatoes from seed sowed last Spring. J. L. W.

PENN YAN, Yates Co., Nov. 24.—From the White Elephant Potato I raised about a peck of fine tubers. They stood the drought better than other kinds. The Washington Oats did first-rate, yielding over one-half a bushel of very plump grain—no smut in them. N. W.

PORT JERVIS, Orange Co., Nov. 24.—My White Elephant weighed just two ounces, was cut into six pieces with an eye in each and planted in six hills in the garden. I dug 65 tubers, weighing 33 pounds; 25 of them weighed 25½ pounds—average weight, half a pound apiece. I had a splendid crop of potatoes and corn this season, and sold my potatoes for a good price—$1 per bushel. I'm glad the RURAL is distributing more garden and field seeds than formerly; for while farmers like to please the ladies of the family with flower seeds, they also like something that will pay themselves in cash for their trouble. J. W.

Oregon.

CANNON, Lane Co., Nov. 20.—The RURAL seeds I had gave good satisfaction. From the small White Elephant Potato I obtained 58 pounds, and there were three potatoes of good size that were not weighed and the ground was not manured or watered. A. D. H.

Wisconsin.

MT., IDA, Grant Co., Nov., 23.—The RURAL seeds did well. I raised 60 pounds of White Elephant and eight pounds of ripe Rural Branching Sorghum seed. C. R. S.

The Querist.

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention.]

FRUITS FOR TEXAS.

T. G., Trenton Falls, N. J., intending to move to Texas next month and there engage in fruit raising, asks what kind of berries, grapes and peaches can be successfully grown in the neighborhood of San Antonio.

ANS.—Most kinds of peaches do well in Texas. As the early varieties ripen in May, they are perhaps the most preferable; the cling-stones are in greater demand than free-stones for local markets. The trees grow well and come into bearing early: but they are not long-lived. Spring frosts or cold, wet "northers" often hurt the peach tree blossoms, and in that way shorten the crop, but taking everything into consideration Texas is an excellent peach State. Early Beatrice, Rivers, Tillotson, Amsden, Alexander, Troth's Early, Crawford's Early and Late, Large Early York, Coe's Early Red, Stump-the-World, Amelia, Columbia, Druid Hill, Yellow St. John, Lady Parham, Baldwin's Late, Mountain Rose, Picquett's Late, Smock, Susquehanna, Chinese Cling (the most favored of all), Indian Blood Cling, Lemon Cling, Old Mixon Cling, Heath Cling, Washington Cling, Rodman's Cling. Grapes are not such a certain crop as peaches are. The vines grow well for a few years, but in many cases soon become enervated. They often bear heavy crops of fruit and not infrequently the grapes rot before they ripen. It is evident we are in need of a set of grape-vines especially adapted for Texas. The Vitis vinifera or foreign grapes have not been grown very successfully in Texas; in fact, phylloxera often kills them there. Agawam, Concord, Delaware, Merrimac, Massasoit, Iona, Israella, Delaware and Hartford Prolific do fairly well in Southwestern Texas and very well in Eastern and Northern Texas, but the Herbemont is the very best of all grapes so far generally tried for Texas. For San Antonio we cannot recommend currants, gooseberries, or raspberries; with considerable trouble and pains some of the latter may be grown. Blackberries in moist places do fairly well. Triomphe de Gand and Jucunda Strawberries have been grown there, but the most satisfactory sorts so far tried are Charles Downing and Wilson's Albany. The neighborhood of San Antonio being rather dry, berries cannot well be expected to thrive there without shelter, a little shade and lots of water.

PARSNIP CULTURE.

C. C., Ontario, Canada, thinking that parsnips would be a valuable crop for feed in that northern latitude, asks how to grow them successfully.

ANS.—The parsnip is not so extensively cultivated for a farm crop as its value warrants. A yield of from 600 to 800 bushels per acre may be obtained on good soil free from stones. The roots are hardy and may be left in the ground all Winter and fed to stock in the Spring, or they may be "pitted" or put in the cellar for Winter feeding. Parsnips will yield best on a deep, rich loam. The ground should be plowed in the Fall, and in the Spring 15 or 20 loads of manure to the acre should be applied and turned under. The seed should be sown just as early in the Spring as the weather will permit and the ground is dry enough to work. The seed should be drilled in rows about two feet apart, so as to admit a horse cultivator. It is well to sow the seed thickly, say four or five pounds to the acre, and after the plants are two or three inches high, thin to three inches apart in the row. It is necessary to use great care in the selection of seed, as no dependence can be placed on seed over a year old.

WHAT AILS THESE APPLE TREES?

E. S. B., Attica, N. Y., says that a good many of the trees in his apple orchard have been killed by some insect that kills the bark at the surface of the ground. This is done in small patches and the surrounding live bark in trying to grow over them forms bunches full of holes. He attributed the condition to borers, but the wood is all sound, the bark only being affected. There are ant hills around the trees and he is inclined to blame the ants for the trouble. Some plum trees, however, are affected in nearly the same way although there are no ants near them, and he asks for the cause and a preventive.

ANS.—We know nothing of this disease personally nor have we been able to find out anything definite about it by inquiry of several well known pomologists. It would be well, however, for our friend to wash his trees in Spring with whale-oil soap or such soft soap as most farmers make, putting it on as thick as he can with a brush. This would be likely to prevent this disease. Or he might take away two or three inches of the earth about the tree and wind around the latter a piece of stiff paper a foot or so wide, which should be tied at the top, and then replace the earth at the bottom. This would probably prevent those trees not affected by the disease from taking it. To use both the wash and the paper would be the better plan.

ANTHRAX IN POULTRY.

W. B. McL., Hudson, Mich., asks what ails her chicks: one after another limp as if they were hurt, shed their feathers, lose the use of their legs and, finally, after tumbling about for five or six days they die. Appetite good; discharge thin; back weak.

ANS.—The disease is a species of anthrax similar to that which is known as black leg in calves. The lameness is the first indication of the trouble and this is caused by an inflamed condition of the muscles of the legs which soon changes to gangrene. As this comes on the feathers die and fall off. The disease proceeds from disorder of the liver; diarrhea and blood poisoning follow and death ensues very rapidly. The disease is too virulent for any hopeful treatment, and when the lameness occurs the case has progressed too far for cure. Preventives only are of any use. These are to avoid overfeeding; to keep the fowls perfectly clean, dry and warm, and to thoroughly ventilate the poultry house. The most perfect sanitary arrangements of every kind in fact are required.

RED AND WHITE WHEATS FOR MILLING.

P. R., Tom's River, N. J., says: "I have read that white Clawson wheat is not liked by millers, as it contains but a small quantity of gluten, and consequently makes a poor quality of flour. It is said red wheat contains more gluten than white and makes better flour. Where is the best red wheat to be had for seed and what is its name?"

ANS.—The percentage of starch in Winter wheats varies from 65 to nearly 77. Clawson probably contains about 74 per cent., and of albuminoids about 9¼. If our friend will refer to our Wheat Number, he will find quite a number of varieties of wheat classed with reference to their milling qualities by Prof. Thorne of the Ohio University. Tappahannock, a white flint, ranks first, followed closely by Lancaster and Red Mediterranean, both red. Either of these two last would, no doubt, suit Mr. R. as to their milling qualities. They can be had of many of the seedsmen who advertise in the RURAL. It would appear from analysis that Spring wheats ought to be more nutritious than Winter, as they contain, on an average, more gluten.

PREVENTING A HORSE FROM PULLING ON THE HALTER.

H. P., Ivanhoe, Ill., asks how to break a horse from pulling on the halter.

ANS.—The most effectual way to break a horse of pulling at the halter is to tie it by the tail. The crupper should be made strong with a ring sewed to the strap on top of the hips, which strap leads to the crupper. In this ring fasten the end of a rope which should be conducted to the head through one of the line rings and through the bit. When in the stable a crupper should be buckled around the tail and the tie rope attached to it by a ring sewed on it; and then passed through a ring fastened to a surcingle round the body and through a ring in the halter. A horse thus fastened will not pull more than once and cannot get loose. A horse in the habit of pulling at the head will break any halter, but when fastened by the tail, as described above a small rope will suffice to hold it.

THE RURAL DENT OR FLINT CORN—WHICH?

A. F. K., Wayne, Ills., says: "In offering premiums on corn the coming year, do the two kinds of corn compete for the same prizes or is there a prize for each variety?"

ANS.—Each subscriber is entitled only to one kind, as may be seen by reference to our first announcement of this Free Seed Distribution and the premiums therefor in the Fair Number, page 585. There we say that for the higher latitudes, the Rural Heavy Dent Corn is not suitable, and therefore the Rural Thoroughbred Flint, which is extremely early, will be sent instead to all who will kindly designate their preference in their applications for the Distribution. The offer of premiums applies to both alike—the best yield from either takes the first prize, and so on with the other premiums.

Miscellaneous.

J. S. B., Bristolville, Ohio, asks, 1, for a description of the Amorpha fruticosa, seeds of which were in our free seed distribution of 1878; 2, do the asparagus plants from our last distribution need any Winter protection; 3, are blue jays a benefit or injury to the farmer.

ANS.—1. This becomes a tall shrub, very variable in different soils and situations. It bears compound leaves with 8-12 pairs. In form and growth it is spreading and, unless cut back from year to year, somewhat rambling. The flowers are of purple color crowded in clustered, terminal spikes. The

THE RURAL NEW-YORKER PRESENTS

FOR THE

BEST YIELDS OF CORN AND WHEAT FROM THEIR FREE DISTRIBUTION of 1881-82

$2,000 Worth of Presents.

WHEAT PRESENTS.

For the BEST YIELDS of the new Cross-bred Wheat "Fultzo-Clawson" from the SEED of the RURAL NEW-YORKER FREE DISTRIBUTION. To be sown next Fall, (1882).

One of Walter A. Wood's latest improved Automatic Twine Self-binding Harvesters, presented by the RURAL NEW-YORKER, $300.

One of Higganum's Automatic Corn Planters, presented by the Higganum Mfg. Corporation, Higganum, Conn. $. 75.

One American Fruit Dryer, presented by the American Fruit Dryer Co., Chambersburg, Pa. $ 75.

One Weed Cabinet Sewing Machine, presented by the RURAL NEW-YORKER. $75.

Fertilizers from our stock of complete manures, pure bones &c., to the amount of fifty dollars, or FIFTY DOLLARS IN CASH, as winner may select, presented by Mapes Formula and Peruvian Guano Co., New York City. $50.

Collection of Flower and Vegetable Seeds and Bulbs, presented by J. M. Thorburn & Co., 15 John St., N. Y. $50.

One Cycle Ensilage Cutter, presented by New York Plow Co., 55 Beekman St., New York. $50.

One Silver-plated Tea Set, six pieces, Tea, Coffee and Hot-water Urns, Cream Pitcher, Sugar and Slop Bowls, presented by the RURAL NEW-YORKER. $48.

Victor One-Horse Grain Drill, presented by Ewald Over, Indianapolis, Ind. $25.

One handsome Silver-plated Ice Pitcher, presented by the RURAL NEW-YORKER. $14.

Collection of Flower and Garden Seeds, presented by R. H. Allen & Co., 189 and 191 Water St., N. Y. $10.

100 Skowhegan Raspberry Plants, presented by J. T. Lovett, Little Silver, N. J. $10.

Collection of New Grapes, one vine each, Pocklington, Jefferson, Prentiss, Duchess, Early Dawn, Vergennes, Highland, Lady Washington, Bacchus, presented by J. T. Lovett, Little Silver, N. J. $12.50.

One dozen Silver-plated Teaspoons, presented by the RURAL NEW-YORKER. $6.

One Keystone Washing Machine, presented by the RURAL NEW-YORKER. $6.

One Silver-plated Cup, presented by the RURAL NEW-YORKER, $4.

√ Special for "Surprise" Wheat.

T. D. Carman, for RURAL NEW-YORKER, for the five largest heads of SURPRISE WHEAT, (see description.) Cash, $25.

CORN PRESENTS.

For the BEST YIELDS of the RURAL DENT or THOROUGHBRED FLINT CORN, from the SEED of the RURAL NEW-YORKER FREE DISTRIBUTION. To be planted NEXT SPRING.

One Loring & Blake Palace Organ, presented by the RURAL NEW-YORKER. (See page 590) $205.

New Spring Tooth Sulky Harrow, with Force-Feed broadcast Seeder, presented by the Wheeler & Melick Co., Albany, N. Y. $60.

Big Giant Corn Mill, latest improved, size No. 2, presented by J. A. Field & Co., St. Louis, Mo. $60.

Farmers' Friend Two-Horse Corn Planter, with drilling attachment, presented by Farmers' Friend M'f 'g. Co., Dayton, Ohio. $55.

Fertilizers from our stock of complete Manures, pure bones, &c., to the amount of fifty dollars, or FIFTY DOLLARS IN CASH, as winner may select, presented by Mapes Formula and Peruvian Guano Co., New York City. $50.

Silver-plated Tea Service, six pieces, Tea, Coffee and Hot-water Urns, Cream Pitcher, Sugar and Slop Bowls, presented by the RURAL NEW-YORKER. $48.

Porter's Patent Wire Cable Derrick complete, with Champion Hay Carrier, presented by J. E. Porter, Ottawa, Ill. $45.

Veteran Corn Sheller complete with Table Crank and Band Wheel, presented by Sandwich M'f'g. Co., Sandwich, Ill. $33.

A selection of Vegetable and Flower Seeds and Bulbs, presented by J. M. Thorburn & Co., 15 John St., N. Y. $30.

Collection of Plants, presented by Peter Henderson, & Co., 35 Cortlandt St., N.Y. $25.

Collection of Vegetable and Flower Seeds and Bulbs, presented by J. M. Thorburn & Co., 15 John St., N. Y. $20.

One No. 3 Cornell Corn Sheller, presented by Treman, Waterman & Co., Ithaca, N. Y. $18.

Adamant Plow, presented by New York Plow Co., 55 Beekman St. $15.

Hoosier Corn Drill, presented by Hoosier Drill Co., Richmond, Ind. $15.

Planet Seed Drill, presented by S. L. Allen & Co., Philadelphia, Pa. $14.

One handsome Silver-plated Ice-Pitcher, presented by the RURAL NEW-YORKER. $14.

Collection of Flower and Vegetable Seeds, presented by Peter Henderson & Co., 35 Cortlandt St., N. Y. $10.

100 Manchester Strawberry plants, presented by J. T. Lovett, Little Silver N. J. $10.

Collection of Flower and Garden Seeds, presented by R. H. Allen & Co., 189 and 191 Water St., N. Y. $10.

One Silver-plated Cake-basket, presented by the RURAL NEW-YORKER. $9.

One Aquapult, (Force Pump,) presented by the RURAL NEW-YORKER. $9.

One Peerless Clothes Wringer, No. 2, presented by the RURAL NEW-YORKER. $8.

Patent Screw Wedge one-horse Cultivator, presented by the Wheeler & Melick Co., Albany, N. Y. $8.

Peter Henderson, four books, Gardening for Profit, Gardening for Pleasure, Practical Floriculture and Hand-book of Plants, presented by Peter Henderson & Co., 35 Cortlandt St. $7.50.

One Keystone Washing Machine, presented by the RURAL NEW-YORKER. $6.

One dozen Silver-plated Tea Spoons, presented by the RURAL NEW-YORKER. $6.

One Silver-plated Cup, presented by the RURAL NEW-YORKER. $4.

---

common name is False Indigo. 2. No, they do not actually need any, but would be the better for it perhaps. A light spread of fine stable manure would be as good as anything. 3. The blue jay (Cyanura cristata) has never won many laurels as a farmer's friend, except in catching insects when it can't get at the farmer's corn-crib. It eats nuts, fruits, grain, sucks the eggs of other birds, tears the young to pieces, and is generally very quarrelsome.

S. G. M., San Francisco, Cal., makes inquiries which may be answered as follows:

The regular price of the Inter-Ocean is $1.15, that of the RURAL NEW-YORKER, $2.00. These we furnish for $2.75, and this *includes* the Free Seed Distribution. That is, all who subscribe for both papers need not *apply* for the Distribution, since it will be sent post-paid, without application. We know of no better weekly newspaper than the Inter-Ocean. All subscriptions for it in combination with the R. N.-Y. are promised immediate attention. Specimen copies will be furnished free to our subscribers, but the application must be made to the Inter-Ocean, Chicago, Ills.

C. P., Springville, Iowa, asks if those who wish to compete for the RURAL'S corn and wheat prizes have to make application in any particular way.

ANS.—We have not decided about it yet. Probably those who so desire will be requested to send in their names and addresses so that they may be regularly entered and so that we may see that all who compete are actually subscribers. Such a list would also prove desirable in case an examination of the competing crops were deemed necessary. Ample time in any case will be given to all. We do not quite understand the question as to the manure-spreader.

G. L. R., Napoleon, Ohio, asks which is the better corn—the Chester County Mammoth or the RURAL Dent; and where can each be purchased and at what price.

ANS.—We have never prized the Chester County Corn very highly, though it gave us one of the greatest yields on record—the greatest, perhaps, all things considered. As to the RURAL Heavy Dent, we do not care to say much at present. It will be thoroughly tested over the entire country next season. It is not yet for sale. Chester County Mammoth Corn will be offered for about $3.00 the shelled bushel.

G. W. H., Toledo, Oregon, asks 1, when should alsike and white clover be sown; 2, where can he obtain the Marlboro Seedling and Souhegan Raspberries; 3. what is the difference between English and Kentucky Blue Grass and when should the latter be sown—climate temperate.

ANS.—1. We should think Fall would be preferable. 2. They will be offered for sale next year we presume. 3. We do not know what is meant by English Blue Grass. Fall for your climate.

W. H., Hanwell, Ia., asks, 1, whether the Rural Dent Corn will mature there; 2, are the Rural wheats all Winter wheats—Winter wheats can't be grown there.

ANS.—1. Probably the Dent will mature; but why not be on the safe side and try the Flint? 2, The wheats have hitherto been grown as Winter wheats, but it will be well to try them as Spring wheats where Winter wheat cannot be raised. We have had good results from growing Spring wheats as Winter wheats on the Rural Farm, and the reverse may prove equally satisfactory elsewhere.

J. T. J., Oakland, Oregon, sends for name a head of wheat and asks whether it is a profitable sort to sow.

ANS.—This is the Egyptian or Seven-headed Wheat. We have never heard it praised either for quality or yield. At the Rural Farm we have raised it as a Winter wheat for two years with indifferent success. The heads mildew, bend over and often rest upon the ground or the straw breaks. See the wheat number for illustration and remarks.

N. S., Remington, Jasper Co., Ind., asks RURAL readers living in that part of Michigan south and west of Lansing to state in "Everywhere" the price and quality of the land there, both improved and timbered; also the kind of timber and the climate, and the sort of commerce carried on in the neighboring towns.

"*Reader.*"—There is no bumble bees' honey in the trade. It would be difficult to get much of it, and then it would be for the most part exactly like common honey.

BONANZA FARMING---AN ANNOUNCEMENT.

The series of articles under the general title of Bonanza Farming will be presented in the following order. First, a portrait of Mr. Oliver Dalrymple. It is due to this gentleman to say that he promised to furnish our Western special correspondents his photograph only after several peremptory refusals, and finally with great reluctance. The second of the series of illustrations will be Breaking; the third Back-setting; the fourth Seeding; the fifth Harrowing; the sixth Harvesting, and finally Thrashing. The illustrations, with carefully-prepared articles, will be begun, if possible, December 31st. Our correspondents wrote us: "We received our notes for an exhaustive review of all the bonanza farming interests under Mr. Dalrymple's management, which, he informs us, 'is the *first time' he* has 'ever given them to the public'; that 'all other writings touching upon the subject have been from desultory information, and most of it wide from the truth.' He remarked, upon separating, that 'having yielded to our solicitations on behalf of the Rural New-Yorker, he believed the forthcoming series of articles would prove the most interesting and profitable of anything upon the subject yet published.'" Mr. Dalrymple is doubtless the largest wheat raiser in the world, and as such the commercial as well as agricultural world must feel much interested in the proposed illustrations and articles. Mr. Dalrymple's portrait will be executed in the best manner and printed upon heavy supercalendered paper as a supplement, similar to that which accompanies the present number of our journal.

We give this week as a full-page supplement an excellent original drawing by our artist, Mr. Scranton, of the head of the Jersey cow Lady Rushmore. It is worth preserving as an ideal type-head of this beautiful and popular breed of animals.

Judging at this time, we shall be enabled to send out our present Free Seed Distribution in time to meet the needs of all.

The Rural New-Yorker controls the greater part of the seed of the new variety of celery, which has been named Golden Heartwell, offered in our next Free Seed Distribution. The value set upon it by the single firm which owns the balance may be judged from the fact that it will be offered for $18.00 per pound and *no less.*

Attention is called to Professor Warder's communication as to the "Ozone"(?) method of preserving food, advertised in our columns and in those of the newspaper press generally by the Prentiss Preserving Company of Cincinnati, Ohio. Professor Warder is excellent authority. Our readers will await a reply to his criticism from the above company before they permit themselves to be influenced by the company's advertisement.

All are invited to send for our Fair Number of 44 pages of this size. This explains our Free Seed Distribution—our two thousand dollars' worth of premiums offered for the best yields therefrom. It presents a number of original illustrations of cattle, swine, new fruits, etc., and finally our premium lists for 1882. The new Rural posters and specimen copies will also be forwarded free to all applicants.

Many of our friends in renewing their subscriptions have occasion to remark upon the crop prospects or to send us other valuable notes for publication. We would thank them to write such matter on a page separate from that which renews their subscriptions, with name and address on each page. Then one page may be handed to the subscription clerks and the other to the editors. When both communications are written together, one or the other has to be neglected or rewritten.

The attention of all our readers is called to the discussion of the regular meeting of the Youths' Horticultural Club of the Rural New-Yorker in this number. Parents should be especially interested, and we call on them to encourage the children in the work in which so lively an interest is shown. Is there a better way in which a love for horticultural pursuits can be created? Horticulture and agriculture are but different forms of the same thing, and the Rural's aim is to present teachings in such an agreeable form to our young people as to create an early fondness for the pursuit. This done, life upon the farm will be viewed as something besides drudgery and young men will stay upon the farm for other reasons than that they cannot find employment elsewhere.

Our arrangements for giving prompt attention to entering names upon our subscription lists are now as perfect as we can make them. Of course, the Rural cannot be responsible for the mistakes of others, or enter names when they are not written legibly or—as in some cases—not at all. Those who subscribe for the Inter-Ocean, New York World or Detroit Free Press and Household in connection with the Rural New-Yorker, may feel assured that their names will be forwarded to those journals at once. It will be remembered that by arrangement with the publishers, all who subscribe for such combinations are not required to forward us the six cents for the seed distribution. The Rural New-Yorker and the Inter-Ocean for one year, $2.75; the Rural New-Yorker and the New York World for one year, $2.75; the Rural New-Yorker and the Detroit Free Press and Household, $3.00.

Country Roads.—Our country roads are by no means such as one can point to with pride. There is money enough spent over them to make them passable, if not excellent, roads. The system is at fault. The annual road work has been done, and the roads are now left to take care of themselves until next Spring. In most cases repairs have been made with ditch scrapings, sods, or soft earth from the road-sides; the loose stones which plentifully cover the roads have been left on them, and occasional water bars—those horrible arrangements for draining the slopes safely—have been made to offer more obstacles for comfortable travel. But the Fall and Winter are the very worst seasons for the roads, and they require more repairs or precautions then, to prevent damage, than at any other season. With our wretched road system no work will be done now or during the Winter, nor until next Spring, when a few neighbors will gather to work out their road tax, and ten men will manage to do one man's work in the very worst manner possible. And this is why we have such miserable roads everywhere, and especially where the country is at all hilly. Pray, let us give this matter a little of the attention it merits.

THE RURAL'S EXPERIMENT GROUNDS.

At the Rural Experiment Farm we have now growing 80 different kinds of wheat. Of the 77 different kinds grown last season, all were rejected that seemed to be inferior to the well-known kinds now in cultivation, while new kinds not yet offered for sale were placed under trial in their stead.

At the "Rural Grounds" (Bergen Co., New Jersey) we have now 106 different kinds of strawberries; 56 different kinds of grape vines; 28 of raspberries; all of the old and promising new kinds of currants and blackberries. As to ornamental trees, shrubs and hardy herbaceous plants, it would be quite a task to count them. Our object is to test everything of promise that is hardy enough to endure the trying climate of the valley in which the Rural Grounds are situated. As to the value of the reports thus made from experience, those who have read our special numbers and the paper in general attentively are the best judges. It is always a cause of regret to us that information so presented is not accessible to our new subscribers.

GREAT DECLINE IN OUR EXPORTS OF DAIRY PRODUCTS.

Last year our average export of cheese was something over 2,000,000 pounds a week; the average this year is scarcely over 1,000,000 pounds a week. Last year the exports of butter averaged from 450,000 to 500,000 pounds a week; this year the average does not reach 250,000 pounds a week. For the week ending November 24, 1880, our exports of butter averaged 324,967 pounds; of cheese, 2,094,577 pounds; of oleomargarine, 455,780 pounds. For the week ending November 23, this year, our exports of butter were 148,630 pounds; of cheese, 1,234,760, and of oleomargarine, 208,530. Even of the above amounts of butter and cheese exported this year, there is no doubt that a large proportion consisted of bogus products. The enormous decline in our exports of dairy products dealers here attribute chiefly to three causes: first, the very wet weather across the Atlantic has been very favorable for pastures there, and consequently the home supply of butter and cheese has been unusually large; second, the drought here has had the opposite effect upon the production of butter and cheese, and the supply having thus been cut short, prices have risen too high to admit of free exportation; third, adulteration in the manufacture of both our cheese and butter with lard or oleomargarine has had a very demoralizing effect upon the sale of even the genuine products in Europe; while the large exportations of butterine and oleomargarine under their real names have competed with our genuine products in Great Britain and the Continent.

THE AMERICAN HOG VICTORIOUS.

How great the evils a fool in high office can cause is shown by the results of the recent war on the American Hog waged by the lately superseded "America-hating" French Minister of Agriculture and Commerce, M. Tirard. In February he began the campaign and straightway about half a dozen other wiseacres in high places in other countries joined him in his warfare. In face of their denunciations and embargoes the exports of the American Hog began seriously to decline in April, as may be seen by the following table of exports for the three months ending June 30, last, as compared with those for the corresponding period last year.

	April, May, June.	
	1881.	1880.
Bacon and hams ,lbs	100,702,010	222,607,111
Pork (middlings)	19,900,983	24,672,051
Lard	68,565,698	125,970,368
Beef, fresh	26,847,180	25,018,721
Beef, salt or cured	7,679,085	13,303,926
Cheese	35,137,232	33,258,056

Inasmuch, however, as the decrease in our exports coincided in a great measure with a shortage in the domestic hog crop, the prices of hog products, instead of falling off on account of foreign ill-will, rose from seven to nine cents a pound for bacon and ham; from seven to eleven cents per pound for lard and from six to eight cents a pound for pork middlings. The greater the opposition to the American Hog abroad, the higher the value patriotically set upon him at home. While half the governments of Europe were carrying on active hostilities against this splendid animal, not only by forbidding his entrance, but by grossly vilifying him among their own subjects, the latter, far more sensible of his merits because better acquainted with him, had soon reason to bemoan his absence, for in June last Mr. Bridgland, our consul at Havre, reported that prices of all meats in France had advanced from 25 to 60 per cent. within six weeks after the embargo on American pork. Small wonder therefore that on the stupid Tirard's exit from official life, the American Hog should have been invited back to France as he had already been invited to Spain on July 10. Thus the two chief foes of this noble beast have already welcomed him as a friend to their tables, and the day cannot be far distant when in other hostile lands, in spite of ignorance, prejudice and stupidity, the American Hog shall be equally triumphant.

We naturally look to those who in the past have been pleased with this journal to speak favorably of it to their acquaintances on fitting occasions. Those who are really interested in agricultural progress are ever ready to advocate the good cause and to this class we are indebted in a great measure for the influence which the Rural New-Yorker now enjoys. We have labored in the past to make it a medium of trustworthy information to all; we have labored to render it worthy of the respect, confidence and friendship of all; and the success which has attended our efforts will enable us for 1882 to maintain the Rural as good in all respects as it has been during the present year and, we trust, in some respects conspicuously better. This we may promise without *any increase* of circulation. It is yet too early to hazard any estimate as to whether our circulation for another year will largely increase or not, The "straws" all point graciously, but such early indications are not always trustworthy. It is now or never, however friends of the Rural, that the work is to be done. We have sown our seed and we have now to await the harvest—anxiously? Yes, very anxiously. A decided falling off in our subscription list would sicken the heart and chill us through and through! If the efforts which we have made through the past to instruct and please our readers have been ineffectual, then we confess our inability to please and instruct them. If the hundreds of reassuring, friendly words we have received mean nothing, we should pray in the future to be delivered from our friends—for their praises do but lead us astray. As the success of a general is determined by the battles he wins, so is the merit of an agricultural paper determined by the number and intelligence of its subscribers, unless indeed a circulation is gained by mere advertising, in which case the patronage—always of a fugitive class (where there is little real worth to hold it)—costs more than it is really worth. While, therefore, we shall confidently expect to hold our present circulation, and to be contented if we do, we yet indulge the fond hope that occasion will enable us to feel very happy over a considerable increase. Then we shall *know* that our readers really care for the Rural, and then, like good school children, who leave their school for the bright Summer vacation, we shall throw up our hats and clap our hands in joy, while with every encouragement we pursue the work of another year. Once again we bespeak the kindly aid of such of our readers as can feel that in aiding the Rural they are engaged in a good work. The single subscriptions sent in by our old subscribers are one of our most powerful aids. It costs them little personal effort to secure a single subscription, while the results to the Rural in the aggregate are immense.

BREVITIES.

Professor Beal says he has found two tubers in one hill pierced by June Grass in the manner recently figured in the Rural for Quack Grass.

In the Editor's Department of the present number of the Journal of the American Agricultural Association is the following: "The Experimental Farm of the Rural New-Yorker—an article on which we print in this issue—is under the direct personal management of the editor and publisher of that journal, who resides upon it. The work which he is doing is of the most practical and useful kind, and we know of nothing being done of more importance to the general agriculture of the country. It is performed in the most painstaking, intelligent and scientific manner and for the public good.

An oppressive patent monopoly has just been exploded by the decision of Judges Drummond and Blodgett in the United States Court at St. Louis on November 25, in the case of the Wilson Packing Company and Libby, McNeil & Libby against the Chicago Packing Company and the St. Louis Beef Packing Company. The question at bar was the validy of certain patents for preserving meat in cans, notably the William J. Wilson patent and the John J. Wilson patent, the former reissued in 1875, and the latter 1877. The former patent was for a process of packing meats by cooking and removing the bones, pressing the meat into cans so as to form a solid cake, and then making the cans air tight. The other patent was for a can of pyramidal form and peculiar construction which facilitated the discharge of its contents. The court held both patents to be invalid; the first for want of novelty, as the process of packing cooked meat by pressure is old; the second because the kind of can patented was a matter of selection not invention; nor was it novel. By this decision the business of canning meats in any shape or style is open to free competition, and so it may be practiced by the farmer as well as by the regular packer. Let the driven well extortionate monopoly go next "where the woodbine twineth."

Miscellaneous.

THE PARK REGION.

Minnesota's Grain and Stock Country Cities, Towns and Pleasure Resorts.

MESSRS. HOLMES AND SWEETLAND.

[Special Correspondents of the RURAL NEW-YORKER.]

THE "Short Line" of the St. Paul, Minneapolis and Manitoba Railway, built to secure through traffic from St. Paul to the West, passes through a very delightful portion of the State, a full description of which with its crop statistics was given in our correspondence "Wheat is Queen" in the RURAL NEW-YORKER of Oct 15. The entire region is rich in wealth of golden grain, the yield in wheat being large and the price proportionately greater nearing the commercial centers. A grand feature of this region is the pure water which is everywhere abundant, and the shelter afforded by the timbered banks of the many lakes together with the abundance of pastnrage for stock. Though Minnesota is in a high northern latitude, possessing an elevation of from 950 to 1800 feet above the sea level, its climate is remarkably healthful and invigorating. The distance is so great to the coast that the ocean's influence cannot be felt, thus rendering the atmosphere dry and pure.

FERGUS FALLS, 54 miles from Fargo, southeast but upon the Red River which curves up in that direction, was our first stopping place. As we intend that our next letter shall deal exclusively with its interests, we will only briefly summarize in this. We found a busy, active town, well built, but evidently upon a hasty plan. Evidences of continued improvement and thrift met us upon every hand. In one direction dirt for a new railroad was flying; in another numerous houses were in process of constructiou; mills and manufactories of lumber, furniture, flour, etc., were utilizing part of their mammoth water power, the best in Northwestern Minnesota. The hotels were crowded—here is something the city really needs, a first-class hotel. The business men were busy, stocks selling as fast as they can be replaced and everybody expressing the utmost confidence in the certain and rapid development of their city. Schools, churches, societies, newspapers, elevators and all the concomitants of refined civilization we will review in our next.

EVANSVILLE, 27 miles east from Fergus Falls, has a population of over 400, business of all lines being well represented by live, active and energetic men. There is a steam elevator here having 110,000 bushels' capacity. Last year 140,000 bushels of wheat were marketed here, and it is expected that more than 200,000 will be marketed, thus showing it to be an excellent grain market. There is a good school for which a new building is being erected now. Norwegian, Lutheran and Union church societies have regular meetings. Adjacent to the town are two brick-yards and a lime-kiln, which will add materially to the future development of the place.

BRANDON, five miles east, has about 200 population, a good school for which a building is in course of erection, several stores, two elevators and the kind of business men who make their example felt. The town is prosperous and improving; it shipped 112,000 bushels of wheat last year, which is a good showing for the market facilities.

ALEXANDRIA, 141 miles from St. Paul, has acquired quite a reputation as a summer resort as well as a commercial point. It is the county seat of Douglas County, has now about 1,500 population, two excellent weekly papers, a graded school of five departments, six church edifices, another in course of construction, and a good hotel. The Bank of Alexandria whose exchange account for the year ending November 1, was over $700,000, and whose aggregate business for same time was $1,800,000, affords ample financial facilities. Here are also stores and stocks of various kinds to supply the demand. Town property sells at reasonable rates, with the prospect of a steady rise in valuation. There are also a good mill and elevator. Above all else, the town is so situated as to be the center of a vast lake region. Lakes Agnes and Winona lie to the north and west, the city overlooking them. Lakes Darling, Latoka, Mary, Lobster, L'Homme Dieu, Carlos, Ida, Chippewa, Christina, Red Rock and Oscar are all within from two to ten miles of the city, all affording excellent fishing and good hunting. Douglas County is out of debt, having neither bonded nor floating indebtedness. The receipts of wheat for this county have been for the year 695,000 bushels, of which 400,000 have been marketed in Alexandria. Being considered a place of headquarters for sportsmen as well as a business center, the future welfare of the city seems assured.

OSAKIS, the Indian for "I like it," takes its name from the lake upon the shores of which it stands. It has a population of between 400 and 500, who have been attracted by its beautiful surroundings and business interests. Quite a brisk little trade is done here, not only on account of its being a pleasure resort, but also owing to the farming country surrounding it. We found a good flouring mill, a sawmill at each end of the lake, a bank, a good local newspaper, "The Observer," several general stores, and dealers in hardware, drugs and groceries. Two trains take dinner at Osakis each day, the Park House being well kept and giving good satisfaction. From the St. Paul Pioneer-Press we will quote concerning Lake Osakis:—"It is in the heart of what is known as the Park Region, a most beautiful and attractive section composed of a succession of lakes, streams and timber lands, forming the most lovely pastoral landscape. In a circle of 20 miles, including all of Douglas County and parts of Todd, Otter Tail, Pope and Grant Counties, are located over 300 lakes, the most important of which is Osakis, which has a shore line of 37 miles, fringed with heavy hard-wood timber and with a smooth and pebbly beach. In this vicinity great quantities of pheasants, water fowl, prairie chickens, snipe, geese, ducks, turkeys, deer and bear are found, affording plenty of sport for the hunter." "Fairview Place Hotel" and cottages, owned and managed by K. Kneutson, we have had occasion to speak of before. They are replete with comforts both for land and water—plenty of boats (steam, sail and row)—and they are crowded with guests during the entire Summer season. Mr. K. informed us of his intention to put up several more cottages in the Spring. Osakis—"I like it"—Well, we liked it well enough to make it our headquarters during our stay in this region, and we could write a column upon our pleasure did space permit.

SAUK CENTER, 13 miles east, is a charming little city of about 1,500 inhabitants, of whom we wrote a special letter, published in the RURAL NEW-YORKER Oct. 8. For some time there has been more or less inactivity in building and improving, but recently the certainty of the Little Falls and Dakota Railroad, now graded, giving them a wheat outlet *via* the great lakes and a direct communication with the magnificent lumber regions of the North has awakened an intense interest, which will give their city a new "boom" and a more lasting one than ever before. Besides this, there is a survey being made for the Sauk Center and Northern Railway, while several other lines are projected.

What the future of a town will be depends to a great extent upon the character of the surrounding country. Stearns County is considered of unusual agricultural excellence. It is well settled as is evidenced by the marketing of 500,000 bushels of wheat in Sauk Center, as well as large quantities at St. Cloud, Melrose and other stations. There have been some experimeuts in Amber Cane which seems to do very well here. We would like to see the Rural Branching Sorghum introduced. Being located in the center of an extended radius, near numerous lakes, thus with the purest water, having well established business houses, good manufacturing facilities, abundant banking capital, excellent newspapers, conveniences for education and religious exercises, appropriate and business acumen, there then is a certainty of rapid improvement and enlargement of the city.

MELROSE we found to be a promising town, nine miles from Sauk Center. It has a large and increasing trade. Its population is nearly 500. The citizens are erecting a fine brick school-house to contain four departments, at a cost of $5,000. Episcopal, Methodist, German and Irish Catholic societies have substantial churches. The Melrose Mills, with a capacity of 100 barrels per day, are doing a large business and draw trade to Melrose, which has good stores, mostly operated by Germans.

ST. CLOUD was next visited. It is the largest city on "the Short Line" between Minneapolis and Fargo, having some 3,000 population. It is handsomely located 75 miles from St. Paul, on the west bank of the Mississippi River, the first point below the pineries upon the edge of the vast prairie region we have written of. The place enjoyed a trade of over $3,200,000 last year. Its principal interest is manufacturing, there being two saw mills, three planing mills, sash, door and blind factories, one novelty works (wood), three foundries, one steam furniture factory, one chair factory, two plow works, one seeder factory, five wagon manufactories and one hub and spoke factory. There is an existing demand and need for large flouring mills, woolen mills, paper mills (straw and rag), agricultural implement works, and numerous other manufacturing industries. C. Bridgman informed us that he sawed 5,000,000 feet of lumber and made 5,000,000 shingles during last year.

THE WATER POWER,

if improved according to the plans of one of the government engineers, would reach 25,000 horse power. This could be done at an expense of one-sixth the cost of the Minneapolis power, and would equal all in use there now. An act of the State Legislature enables Stearns and Sherburne Counties to vote aid for this purpose, and the city of St. Cloud offers a bonus of $50,000 cash for its development.

A vein of granite, gray, blue and red, capable of high polish, extends southwest from Duluth and near the city, while along the river banks are found large amounts of hard wood timber. Besides the St. Paul, Minneapolis & Manitoba Railway, St. Cloud has the Northern Pacific, Duluth Railroad expected, St. Cloud and Lake Traverse now being graded, the Osseo branch being finished within 12 miles, and others projected, thus giving abundant railway facilities. St. Cloud has six handsome churches, two of brick; two brick school buildings costing $40,000, with graded schools of 11 departments; also one of the three State Normal Universities, which has a faculty of eight experienced and capable teachers, and an enrollment of 265 pupils from all parts of the State. Their handsome building is worth $60,000. Add to this three prominent newspapers—Journal-Press, Times, and Nord-Stern (the latter German)—four civic societies, an adequate banking capital, stores and stocks of metropolitan aspect and substantial improvements of brick and stone (both materials being close at hand). Imagine yourself in this busy county seat of Sterns County, mingling with a mixed social element about equally divided between Americans and Germans, standing perchance near a fine new opera house or by the banks of the Father of Waters, watching its turbulent flow, and gazing at the many manufactories which now use its mighty power, and you have a pen-picture of St. Cloud to-day.

Between this city and St. Paul are several towns, the principal of which is Anoka, which manufactures many million feet of lumber annually. In fact, the region east of St. Cloud is principally timber. As a supplement to this sketch, which covers such a diversified scope of country, it will serve best as showing the immigration to the Northwest *via* the St. Paul, Minneapolis and Manitoba Railway to give a statement of James B. Power, their land commissioner, concerning their sales:—During the months of September and October, 41,517 acres were sold to 210 purchasers, at an average price of $5.70 per acre; 25,850 acres were contracted to be improved. During the same time 25,385 acres were sold in the contested limits (which includes Otter Tail and Clay Counties). At this rate it will not take long to dispose of the entire land grant, and the prospects for the coming year's improvement all along the line are certainly very flattering.

The Herdsman.

OUR SUPPLEMENT.

OF ALL the various breeds of neat cattle there is none that surpasses the Jersey in deer-like grace and high-bred appearance. Under the fostering influence of a genial climate, a fertile soil, kiud and generous treatment, and a scrupulous watchfulness as to purity of blood, the Jersey cow has ripened into a small, gentle and exceedingly useful animal, "famous alike for meekness and for milk; for butter and for beauty." It is this thoroughbred aspect that renders a herd of Jerseys in a gentleman's park in England almost as ornamental as a herd of deer. Just look at this head and say whether you have ever seen a handsomer one belonging to any other breed; and in the Jersey the head is by far the most characteristic feature. How well, too, are the "points" in the scale of this breed illustrated in the head, which, by the way, is by no means merely a typical one, originating in the artist's imagination or memory, but a real flesh-and-blood head borne by a very excellent cow, "Lady Rushmore. "Head small, fine and tapering. Cheek small. Muzzle fine and encircled by a light color. Nostrils high and open. Eye, full and placid. Horns smooth, crumpled, not too thick at the base, and tapering. Ears small and thin, of a deep orange color within. Throat clean. Neck straight, fine and placed lightly on the shoulders." So pithily runs the "scale of points." It might also have said, if it were not confined to essentials, that the nose is either dark-brown or black, though occasionally of a yellowish shade; that the face is slightly dished, clean of flesh, mild and gentle in expression; that the clear, full eye is usually encircled by a ring of the same color as the nose; that the inward-curving horns are waxy in color, with black tips in animals enhanced in price by the possession of the "black points;" and that the neck is often somewhat depressed, or what is frequently called "eye-necked." The whole head, as seen, is original and eminently blood-like in appearance.

Lady Rushmore, No. 11812 in the American Jersey Herd Register, was imported in October 1880 from the Island of Jersey by her present owner, Mr. Aaron A. Degrauw, of Long Island, New York. She was bred by Nicholas Le Rossignol Baumont, of St. Peters, out of the "foundation" stock of the island, and was dropped September 15, 1878. She dropped her first calf on December 3, 1880, after which she gave an average of 18 quarts of milk daily on ordinary feed, producing 15½ pounds of butter in seven days. In July, six months after calving, on testing her milk it was found to yield 35 per cent. of cream. She is solid fawn with full black points and a fine escutcheon. Her pictured head is worthy of a nice frame, not only for its high artistic merits, but still more as a fine typical representation of this deservedly popular breed.

NOTES BY A STOCKMAN.

THERE must be something radically wrong in a system of agriculture under which, while a population is increasing and business and money wealth yearly grow larger, the farmers are impoverished and their live stock are rapidly diminishing. Vicissitudes of weather and season are not sufficient to account for this condition of the live stock in England, which is shown by the official returns for 1881 to have decreased enormously in number and value during seven years past. The following table shows the difference.

NUMBER OF LIVE STOCK IN GREAT BRITAIN AND IRELAND.

	Cattle	Sheep	Pigs
In 1874	10,281,036	34,837,397	3,537,354
In 1881	9,904,003	27,899,737	3,149,675
Decrease	377,033	6,937,660	387,679
Decrease in value	$22,620,180	$69,376,600	$2,905,000
Average value per head	$60	$10	$7.50

THESE figures are interesting to compare with those of our own stock. There are more cattle in Texas than in the whole of Great Britain and Ireland (? EDS.). In regard to sheep we now surpass Great Britain considerably. There were 7,000,000 pigs slaughtered last year in Chicago alone, leaving the great pork centers, Cincinnati, St. Louis, Kansas City, Milwaukee and several other large towns out of the question.

BUT what is the reason that the live stock interests of our mother country are in a state of decadence? Is it the system of landlordism and the burdens of taxation required to support a costly government that is at the root of this evil? I don't like to hazard a solution of this question. But I feel safe in believing that the difficulty is one of slow and gradual growth and cannot be removed without some radical change, and that the consequences implied and which affect our interests as competitors with England will be permanent.

CATTLE and fences are co-incidents. Fences are made to keep out cattle and as the fields under crops are many times larger than the pastures, so the fences required are many times more numerous than they need be were the cattle fenced, and not the crops. Here is something that needs consideration as an element in the economical working of the farms. One cow loose upon the roads makes a thousand dollars' worth of fence necessary to keep her out of mischief. And yet farmers permit their neighbors to let this one cow run at large.

THE Fat Cattle Show at Chicago has been the great sensation of the period among Western cattle men. The contest for superiority between the Short-horns and Herefords has been close and it may be said that it has been a drawn battle between them. A Short-horn steer bred by J. D. Gillett, of Elkhart, Ill., carried off the principal prize as first in the sweepstakes for steers three years and under four years old. A Hereford, owned by T. L. Miller, Beecher, Ill., came second.

THE ages and weights of the three prize cattle, first, second and third of this class are as follows:

	Age in days.	Weight.	Average gain per day since birth.
Shorthorn	1,237	2,095	1.61 lb
Hereford	1,190	2,035	1.71
Grade Short-horn	1,324	2,085	1.57

The Short-horn steer was subsequently awarded first premium as the best animal shown of any class or age.

THE Hereford breeders gained the prize of $250 for the best herd of five animals of any age or breed. T. L. Miller & Co. took this prize with five Herefords which weighed 10,000 pounds exactly, or an average of 2,000 pounds each.

THE competition between these two breeds runs very close and will probably stay so, for the Herefords have a long history behind them and have been too long a first-class established breed to be thrown into the background now even by a Short-horn. The good points and profitable excellencies of these two breeds are so nearly balanced and the scale trembles and oscillates so much, that it is never certain which is to stand first in such contests as this fat stock show. Hereford cattle carried off the first prize for slaughtered beef in the grand sweepstakes for any age or breed; also for three-year-old steers and for one-year old; the prize for two-year-old going to a Short-horn. [Other "Notes by a Stockman" are crowded ont of this issue.—EDS.]

Literary.

THORNS AND ROSES.

(Continued from page 818.)

CHAPTER XII.

SINCE the evening on which I had spoken to Nevil of the fancied change I had not seen him; but this did not alarm me, as I thought he would be staying with his mother rather more after having lately devoted so much time to me.

I resolved without further delay to see Brandon, and be put at rest for ever; as I had no opportunity of speaking to him in aunt Dorothy's presence, I would seek him at his home, there being nothing unusual in my wandering through the forest, and possibly I would meet him.

So this sunny afternoon rode out. Diamond, after his long rest, enjoyed the fresh air, speeding through the lane and over the common in a wild gallop; and my spirits revived as I felt the wind against my cheek, and saw the beauty of Summer.

But when we neared our destination my heart sank again; though it was better to be straightforward with Brandon, and I could have no peace until I had spoken to him. I felt afraid. Why should I? He would clear himself, and I should feel ashamed of having let the word of a stranger influence me against him. I left Diamond in charge of the lodge-keeper, and went towards the forest on foot. I remember as I walked slowly on how I had met Braudom first; after my return, how happy I had been, how little I had known of sorrow. To what was I going now? To hear him tell me of his father in his own kind way, or what? As I thought of him, his face with its look of sadness rose before me, and the horror of the bygone Spring days returned.

The sorrow seemed to pass away as the outer world melted from my gaze, and the old mossy trees arched over me "voiced with the voice of centuries." I loved the forest; its stillness, its peace ai d freedom, were dear to me; it was good to be here alone in the holy of holies of earth's temple. I leaned against the ivied trunk of a tree, and a wandering breeze swept over my head like the passing touch of a light, cool hand. I stood silent when Brandon appeared.

"So you are the trespasser, Kate?"

"Trespasser! I have a right of way through these woods from time immemorial."

"True! Why didn't you call at the house?"

"I think I came here for peace; the forest has some soothing influence for me as it ever had."

"You loved it as a child," he said, supporting himself against a gnarled trunk. "Is aunt Dorothy well? Any letters from Edith!"

"None; she is not going to write again, I think."

"And Nevil—how is he?"

"Very well. Are you wondering why I came?"

"Not I; you are so often here, and so fond of the woods. I was thinking of you when I heard Nero's bark; but perhaps you want me for something."

"Only to talk, Brandon."

"Only to talk!" he repeated. "What wonderful 'talks' we two have had! No more shadows, I hope? Talk of Nevil, or old days."

"In old days I often came here, Brandon."

"Didn't we pretend to be outlaws, and Robin Hoods, and Ivanhoes? All pleasant memories belong to you, sister of my youth, and you alone can wake them. It is good to look back on bright hours."

"Our early days were bright, brother. Even now you stand apart from all others to me. Like me, you love the past; like me, you recall its joys; like me, you are an orphan!"

He looked at me quickly, but I did not meet his eyes.

"Oh, yes, Brandon! And I love the past; I love to trace, step by step, my life and yours, for they were as one. You know all mine; I know all yours save one part, which is ever veiled."

"And what part is that?"

"You know all mine, and of all who came in it; I can speak to you of those dear to me whom I have lost—my father, my mother. You have spoken of your mother, but not of him. I can remember seeing him before I went to school, and have often wondered why you never spoke of him. Was there something painful about his death, dear, of which you would not tell me?"

"Good Heaven!"

Shall I ever forget the instantaneous change—the look of fear, horror, and dismay, all blended in his eyes? Every vestige of color had left his face, and for one moment he looked thus at me; then, turning away, clasped his hands over his eyes with a sob of agony.

What had I done?—what had I said? Trees and flowers melted into an indistinct mass; the pain at my heart was so intense that I could hardly breathe; fear and terror swept over me like a torrent.

"Brandon!" I cried, in a voice that startled myself, "speak to me for mercy's sake! Dear Brandon, only say a word!"

He held out his hand as though to bid me be silent; but I could not obey him.

"Brandon, do speak! I did not know what I was doing! Only say you forgive me!"

I looked at him with streaming eyes, but he turned now, still white, yet calmer:

"Forgive me, Kate. I should not have frightened you so, but I could hot help it; I was—I——"

"Oh, don't? Only say you forgive me!"

"You did not know that you were touching a wound still bleeding, dear; and I was wrong to let you see it. You did not mean to pain me."

Humbled and sorrowful I stood before him, the quiet words hurting me more than would have the bitterest reproaches.

"There was something about my father's death of which I cannot tell you; I cannot bear to speak of it. It is one of my secrets. Sister you will not ask more; you will not speak of it again. You cannot know the feelings it wakens in my heart—shame, dread, remorse——"

"I wish I had died before I spoke of it, Brandon. I never wounded you until now."

"Never mind," he said, clasping my cold hand; it is over, and we will say no more."

"You know I would not ask you from mere curiosity, or——"

"I know you asked me in your sisterly love and sympathy; but say no more. I shall never forgive myself for having frightened you so."

I leaned against the tree, and closed my eyes; never before had I seen Brandon so affected, and my hand had struck him, my words had so pained him—mine, whose life was made beautiful by his love! How should we meet after this? With embarrassment, coldness, and restraint? He would look on me with something akin to dislike. Why had the hateful words escaped my lips? Sisterly love and sympathy! My face burned with shame.

"I must go. Would you walk with me, Brandon?"

For an answer he gave me his arm, and silently and sadly we passed through the forest. I did not speak until we reached the garden, and a brighter light shone upon us.

"Brandon, do not be angry! Oh, my brother, I had no thought, no intention! Try to think so!"

He laid his hand on my shoulder, and bending, he kissed my forehead for the first time in his life.

"I need not try, my child. But you are making too much of this; it has passed forever, and shall be forgotten To be angry with you is impossible. Nearly all have a buried sorrow, and you unconsciously walked over the grave of mine, that is all. Not another word. I shall be at home to-morrow or the day after."

I gave him my hand, and with the old kind words we parted.

I had come to him in search of peace; but I bore away another burden—another shade was added to my darkness! I might have known that he would keep nothing from me unless he had a strong motive for doing so; and when he had shrunk from all mention of his father, in kindness I might too have been silent. How could I ever seek him again? How speak again of the dear old days?

On arriving home I hastened to my room to efface the tear-stains, I threw off my habit, and thought, as I was thus occupied, over that scene. When the very mention of his father's death had so completely shaken him, I could not have continued, and told him what I had heard. But—was this another proof of his guilt? When my thoughts came thus far I stopped myself. From this hour I would banish that story and all connected with it. I had made this resolution before, and had broken it; this time I would keep it, though my struggle were life-long.

I went down stairs to aunt's parlor, to find Nevil alone, pulling the leaves from a yellow rose; and overjoyed to see him, I hastened in

"You're dreadfully pale," he said,; "and after a ride you shouldn't be. I came to tell you something. I am going away."

"Going away, Nevil? Will you be away very long? You'll write?"

"Yes, but it is pressing business to which I must attend."

"Your mother will be lonely, but I shall go to see her; and your letters, dear, will be so precious."

"Yes; I must say good-bye to day, because I shan't have time to call to-morrow."

Once again we had a "twilight tea," aun talking to Nevil, I watching the birds flying home across the sky; once again I walked with him down the long avenue, the scented wind ruffling my hair, and I pulled a deep red rose as we passed the fragrant bushes. When he said "Good-night" I gave it him; he fastened it in his coat, and before leaving the garden looked back, waving his hand as I stood in the shadows.

So we parted—our first separation—and I saw not our meeting; it lay hidden in the mist of the future, and what it would be I did not know.

To be Continued.

For Women.

CONDUCTED BY MISS RAY CLARK.

MY TRUNDLE BED.

As I rummaged through the attic, listening to the falling rain
As it pattered on the shingles and against the window pane,
Peeping o'er the chests and boxes, which with dust was thickly spread,
Saw I in the farthest corner what was once my trundle bed.
So I drew it from the recess, where it had remained so long,
Hearing all the while the music of my mother's voice in song,
As she sang in sweetest accents what I since have often read,
"Hush, my dear lie still and slumber, holy angels guard thy bed."

As I listened, recollections that I thought had been forgot,
Came with all the gush of memory rushing thronging to the spot;
And I wandered back to childhood, to those merry days of yore,
When I knelt beside my mother, by this bed upon the floor.
Then it was, with hands so gently placed upon my infant head,
That she taught my lips to utter carefully the words she said.
Never have they been forgotten, deep are they in mem'ry riven,
"Hallowed be thy name, oh! Father, Thou who art in heaven."

This she taught me, then she told me of its import great and deep,
After which I seemed to utter "Now I lay me down to sleep."
Then it was with hands uplifted and in accents soft and mild,
Then my mother asked our Father, "Father, do Thou bless my child."
Years have passed, and that dear mother long has mouldered 'neath the sod,
And I trust her sainted spirit revels in the home of God.
But that scene at Summer twilight, never has from mem'ry fled,
And it comes in all its freshness when I see my trundle bed

THE PRESENT MAN.

A CORRESPONDENT says: "We can put up with a good deal of simpering nonsense from a pretty girl." You can, hey? and how does that redound to the glory of man. What in the mental calibre of one who entertains such ideas! Could a gentleman of intellect enjoy the society of a girl who has nothing but her pretty *face*? Can he feel that he has been paid for exerting himself to entertain one upon whom it is all lost. Cares he for no response, save perhaps a simpering "why ain't you awful, or "you horrid man!" (for these words are heard in what is considered fashionably society,) and an empty hollow giggle, from between the beautifully outlined lips, which reminds one of cupid's bow. We have met with those who so thoroughly enjoy *themselves* that no need ever arises for help from an outside source. To such, a companion like the one described would be a *rich gift*.

Our correspondent goes on to say that "a pretty woman knows that she is so," and asks "is it not strange that she never knows when she is the *other?*" and affirms that "a homely damsel must deport herself with straight-laced decorum, or she makes herself ridiculous." What a statement! How many of those who have adorned the literary world were handsome? The sweet spirited and pure minded Cary sisters were far from possessing handsome faces, but who can deny their being radiantly beautiful when lighted up by the soul-life that dwelt within and was always visible to one who looked into their eyes, so gentle and kind; no one would think of applying the word "ridiculous" to them. These do not stand alone; we could mention such almost *ad infinitum*.

But is it a fact that men prefer a pretty face and are ready to "put up"—for a lifetime, remember!—with that which has only the one thing, beauty; to one that is plainer, though crowned with an intellectual forehead, has a bright soul-lit eye, and from whose lips come words indicative of thought and culture, and whose mind is a storehouse of beautiful things.

No! no! we are glad to believe that the day has not yet come when the masculine heart and mind can be satisfied to bestow itself where it cannot *grow* and receive nourishment. Take courage, homely damsel, you will be loved by the strong and *noble*, only see to it that you have as much to give in return.

DESCRIPTION OF CUTS.

FIGS. 552 and 553 — BACK AND FRONT VIEW OF GIRL'S DRESS.—We give cut of a dress for a girl from five to ten years of age, and

FIG. 552.

take pleasure in so doing, because we know how difficult it is for mothers to get the right kind of pattern, one that an old dress can be remodeled by, and made to look as good as new. A princess dress can be converted into such an one as the cut describes, by a little ingenuity. When made from new material, we would suggest navy blue cashmere, and satin the same shade, using this for the puffed piece that forms the back and front; also, for pipings around the overdress or polonaise.

FIG. 553.

Another, somewhat more dressy, can be made of dark maroon, or wine color, with sat in same shade, using pink satin for pipings, all around, and a box pleating about one-half inch wide, when finished, around the bottom edge of skirt.

Domestic Economy

CONDUCTED BY EMILY MAPLE.

ECHOES FROM EVERY-DAY HOUSE.

ANNIE L. JACK.

Christmas Gifts.

WE have just been to the city and brought back some ideas regarding little gifts that every one wants at the time of "good-will" near at hand.

In one house where we made a call, the lady was very busy making up tidies as a present to a young housekeeper. The centers were of blue satin with wild rosebuds painted by hand. Next came an insertion of lace; then a quilling of ribbon of the same shade as the satin, and a deep lace edging. The latter and the insertion can be either hand-made or bought. Another friend was covering a small table as a gift. The cover was crimson velvet, the border worked in crewels was white azaleas with tassels in white and crimson chenille. This was an elaborate piece of work. A little girl was working very quietly at a satchel of velvet, for wearing at the side, lined with satin, the only cost of the satchel being the cord and clasp, as she had the velvet in her piece bag. She was also making a fichu of lace and velvet for a kind aunt. A young lady who had charge of a library was using her spare moments working in fleecy zephyr a white hood for her first neice, and a pair of tiny mittens to match.

Whisk-holders are plentiful in the decorative art rooms, and easily made. If one has

an artist in the family (and a voice says "Most people have nowadays") it is easy to make up cheap gifts by the aid of a little taste. Christmas cards, hand-painted with an appropriate motto, give pleasure to the worker and bring out many pretty sentiments. Penny fans can be covered with scraps of satin or silk from the piece bag, and gaily painted—the larger size making good hand-screens. A plant in bloom is an acceptable gift to one who loves plants and does not possess many blossoms, while a tastefully arranged assortment of Autumn leaves is sure to find favor. Gentlemen are always pleased with knitted suspenders and slippers. They are things that are sure to be needed for they are always wearing out.

A friend who had spent the Summer at the seaside was busy making up splint baskets, and filling them with the treasures she had collected from sea and shore. "Every-day House" has had a side view of the home taken, and is making it a Christmas card to give to a few friends. This is always an acceptable gift, especially to the absent. For children cheap boxes can be bought and covered with some bright goods, afterward filling them with good candy, or if for a little girl, a stock of gay spools and some needles will be better appreciated. People in the country can often give their city friends pleasure at Christmas time by a gift of something their friends have to purchase at high prices. I remember one year when I did not feel inclined to go to the city, or spend much money, we gathered the various lycopodiums in the woods, some Bitter Sweet and a few wild everlastings, with here and there an acorn or a lichen. These were made into wreaths, anchors, crosses, and, with a pretty Christmas card attached, were well received, and valued more than if we had bought some trifling gift with money.

A pretty basket lined with moss and filled with rosy apples sent to a city friend is sure to find favor. In the hall of one house I saw a bag made of fine lace used for holding a clothes-brush. It was a gift of last Christmas, as was also a knitted skirt and slippers in a pretty box sent to an invalid lady. Sets of dinner cards hand-painted are very pretty, as are some of the mats for finger glasses done in charming Kate Greenaway figures. Where there is a fret sawyer, what pretty things can be made in brackets and picture frames, and I know a family of boys who with a turning lathe made a set of croquet mallets and balls that were valued highly as a Christmas gift. And in your gifts do not forget the poor—to children who have not much pleasure or riches the present of a last year's toy will carry with it a message of "good will."

HINTS.

WHEN ice is required at night for a sick person, break it into small pieces, and if it be scarce and care must be taken to prevent its melting, put into a soup plate, cover with another plate and put between two feather pillows.

Never wear a good woolen dress into the kitchen without the protection of a large apron.

No flannel that has not been carefully washed and is not perfectly soft and fleecy should ever touch the skin of an infant.

We never had any patience with a mother or nurse who would stick pins carelessly into her dress, collar or ribbon thereby inflicting painful wounds on her innocent victim. Not a pin excepting a safety pin should be used about a child, and when buttons will perform the office of pins they should be made to do so.

To mothers, aunties or sisters who do up the school luncheon for the youngsters; pray make it as attractive in appearance as possible. There is truly nothing very inviting about a thick piece of dry bread and butter and a cookie, all rolled in a piece of coarse brown paper, washed down by a drink from the cup that "goes the rounds." Such a lunch will often impair the appetite of a fastidious or delicate child and he will go without rather than eat it. A little care in the cutting of the bread; the doing up of the cookies or crullers in tissue or white paper; the sauce or custard put into a pretty cup and all wrapped in a clean white napkin within a *bright* tin pail, or, better still, a pretty lunch basket, will by the pleasure it gives the child, well repay the extra care and thought.

BUTTER LADLE PAPERS.

MAY MAPLE.

"WHAT miserable butter Mrs. Long does make!" was the exclamation of Mrs. Gray, as we wended our way homeward one Summer evening from the house of our mutual friend. "I have often wondered why it was, for in most things Mrs. L—— is as tidy about her work as are the generality of housewives."

Now, Mrs. Gray was not given to fault-finding or general gossip, but we were old school-mates and confidential friends, and sometimes expressed our thoughts in strong language.

The butter placed upon the tea table was white, frothy stuff; quite unworthy the name, and I had never seen anything better on Mrs. Long's table when of her own manufacture. But there came a time when to me, at least, the mystery of that "miserable butter" was solved, and I have no doubt a like fault is the cause of hundreds of pounds of the miserable stuff that not only finds its way to the table at home, but is thrown upon the market as well. Several weeks later I had occasion to call on Mrs. Long, and was invited to take a seat in the kitchen, which was as clean and airy as need be, until she could put the cream in the churn, that Helen might do the churning before going to school. While we were talking I was taking observations, or, as our old Professor used to say, "taking field notes," for I like to learn modes and manners of doing work.

"Have you done one churning this morning?" I inquired, as I saw the lady turning very sour buttermilk from the old-fashioned, wooden churn.

"Oh, no!" said she, laughing at the idea. "I seldom have occasion to use the churn oftener than once a week, unless we have a run of company, and get out of butter. We have but one cow and, of course, do not have large quantities of cream on hand at any time."

The conversation soon turned upon other subjects, but I continued to take notes mentally. The cream that had been nearly or quite a week collecting was put into that sour buttermilk churn, the sour dasher and soiled, musty cover were soon adjusted, and the work of bringing the butter was ready for Helen, while her mother and myself adjourned to the cool, pleasant sitting-room, where order and neatness reigned. In something less than half an hour Helen called her mother to take up the butter; and I arose to take my departure. But people in farming districts are seldom formal, and when Mrs. L. offered to go walking with me if I would wait till she could take the butter out of the churn and salt it, I could not well refuse, so we returned to the kitchen and I seated myself near the door that opened into the garden.

"What desperate weather to make butter," said Mrs. Long, "the cream doesn't more than half separate, and the little butter that does come, is very soft. I shall be glad if the weather ever does get cooler, then we can make more butter with less labor; but by that time I suppose the butter will be bitter with the herbs the cows get by the side of the fences."

I did not tell my friend that the reason why she made poor butter and but little of it, was because she did not skim the milk as soon as it was sour; or that she ought to wash and scald her churning utensils immediately after using them. Even the butter bowl, containing the last batch of butter, had stood for several days in the cellar, and this was also used without washing, and it was damp and musty as I very well knew; but the new butter was put into it and salted and put back in the cellar before a quarter of the buttermilk had been worked out. To me there was no longer any wonder that poor butter was the rule and not the exception in that dining-room.

CULLINGS.

CARROTS make excellent pies when sifted and made up like squash or pumpkin.

The taste of iron can be taken out of new kettles by boiling hay in them for several hours.

In starching black calico use glue, or if starch is preferred, make it with coffee instead of water, and iron on the wrong side.

To remove fruit stains from the hands, rinse in clean water and rub tartaric acid on the discolored places.

If things will get scorched in ironing, the discoloration can be removed by laying in the sunshine, if not too deeply burned.

Light kids may be cleaned in this way: put on one glove at a time and with the ungloved hand wring a clean towel through skim-milk and wipe off the soiled glove.

Sweet clover, lavender or rose geranium leaves, put away into bureau drawers are a sweeter perfume than many bought extracts.

A. L. J.

Fernwood Butter.

We received from Fernwood Farm, Cazenovia, N. Y., two pounds of butter made from imported Guernsey cows. The butter is formed into little bricks, three-and-a-half inches long, two-and-a-quarter wide, not quite two inches thick and known as "Fern Leaf Print." Accompanying the butter was the statement: "Made on hay and uncolored." It is of a true, golden color, and, as to quality, it seems to us perfect in all respects.

New Publications.

SOME OF LEE AND SHEPARD'S NEW BOOKS.

ILLUSTRATED.

HE GIVETH HIS BELOVED SLEEP. By ELIZABETH BARRETT BROWNING. With full-page and letter-press Illustrations. Small 4to, English cloth, full gilt, $1.50. Uniform with the series of Illustrated Hymns and Poems.

News of the Week.

HOME NEWS.

MONDAY, Dec. 5, 1881.

THE GUITEAU TRIAL.—And still it continues. On Monday the prisoner was put on the witness stand to identify certain letters that he had written, and on Tuesday his regular examination began. Several experts in insanity watched, and listened to Guiteau very attentively to discover any signs of insanity. Judge Porter for the prosecution, conducted the cross-examination of Guiteau. Throughout the prisoner insisted on making the Deity responsible for his act, and under all the severe questioning of Judge Porter he never deserted the position he had taken on the question of his own responsibilty. Whenever the words "murder," "malice" "intent to kill" were introduced the prisoner almost invariably refused to reply. On Friday the cross-examintion was closed. Though Guiteau was driven to the wall several times by the sharp questioning of Judge Porter, he maintained to the end that the responsibility was God's not his own. Mr. Scoville then proceeded with the re-direct examination of Guiteau and other witnesses.

A silver star marks the spot on the floor of the Baltimore and Potomac Railway station where President Garfield fell when shot. A beautifully carved marble tablet was placed on the wall above it on Wednesday. An eagle, holding in its claws arrows and laurels surmounts the stone, on which is inscribed: "James Abram Garfield, President of the United States, shot July 2, 1881."

At Rock Island, Ill., the coroner's jury in the case of the steamer Jennie Gilchrist wrecked a short time since, finds that the boat was run at night in violation of law. She was properly equipped, and the engineer did his duty, yet the master and pilot were incompetent. There was no lookout required by law and no word was sent to the passengers of their danger, and no efforts made to save helpless women. The action of the mate, James Heir, in not making an effort to save the women and children is denounced as cowardly. The jury declares the duties of master and pilot should not be vested in one person on any steamer authorized to carry passengers.

At Decatur, Texas, the court house burned, Monday; loss $15,000. All the cattle brand records of the county were destroyed. It is feared this will throw the cattle business into inextricable confusion and lead to many crimes of violence. It is suspected that the fire was started by persons interested in having certain brand records lost.

A memorial of the late Thomas A. Scott is to be raised in Philadelphia in the shape of a handsome church, the pews, of which are to be free.

"Doing Wonders for Me."

A lady at Royalton, Vt., says, after using Compound Oxygen for three weeks: "I was very weak and low when I first inhaled. I had to be helped to rise from the bed, and could only sit in the chair while inhaling. The second night after inhaling I rested better than I have for two years. Ever since, I have gone to sleep early; rested well and waked early, feeling rested and refreshed. Have been gaining in strength; can now walk about some, and sit up nearly half the time. I rode two miles on Saturday, and was not as tired as I expected to be. My friends think it is doing wonders for me." Treatise on Compound Oxygen, *sent free*. Drs. STARKEY & PALEN, 1109 and 1111 Girard Street, Philadelphia, Pa. —*Adv.*

AGRICULTURAL NEWS.

MONDAY, DEC. 5, 1881.

THE following items of agricultural news are condensed from telegrams received here from Friday noon December 2, to noon today: Boston, Mass.—No improvement in flour market. Demand light; prices unchanged.....

Philadelphia, Pa.—Thursday and Friday cotton went up ⅛@¼c, and prices are now firm with an active market. General tone of the wool market firm and quiet. Good demand for choice lots of fruit. Butter steady; creamery, Extra Pa., 41c; do. Western, 41c; good to choice, 36@39c; N. Y. extra tubs, 32@33c. Eggs in good demand at 33@34c for Pa., and 31@32c for Western. Potatoes firm. Green salt hides dull; a decline of ¼@½c per pound. Calf skins in demand. Choice sheep skins scarce and prices higher. Little or no variation in flour or grain since last advices, though wheat is a trifle higher, and corn too a shade stiffer.....

Utica, N. Y: Butter: Creamery 32@35c. Cheese 12@14c.....Cincinnati, Ohio: Weather still unfavorable for pork packing, but prices are well sustained. Common and light hogs $5@6.50: sales in the week 13,000; exports light. Business in grain larger; prices weak—No. 2 red winter wheat $1.38. No 2. mixed corn 65½. No. 2 mixed oats, 48¼@49c. Rye $1.04½. Tobacco in good demand with satisfactory offerings. Transportation lines south have advanced prices a little.....Louisville, Ky.: Leaf tobacco steady; bright grades strengthening. Country collections slow; many merchants paying more attention to collecting debts than to the sale of goods.....Chicago, Ill: An improved speculative demand in grain and provisions. Receipts of breadstuffs during the week 79,359 barrels flour; 194,711 bushels wheat; 822,498, of corn; 371,377, of oats. Shipments, 60,366 barrels flour; 175,994 bushels of wheat; 808,242, of corn; 152,805 of oats—a great falling off in the last. Cattle and hogs in good supply. Receipts of hogs for Nov. 250,000 less than for Nov. last year.....Detroit, Mich: Cold weather has made country traveling better and augumented interior traffic. Prices of staples firm and likely to be. November was in wheat the biggest speculative month of the year, sales of options aggregating 12,800,000 bushels. The month's receipts were the smallest reported, being 516 cars against 2,600 last year. Receipts of corn and oats were the largest in five years.....Milwaukee, Wis.—Rainy weather and very bad roads still continue to materially retard the shipment of merchandise and crops. Wheat market unsettled and prices have been fluctuating sharply. Receipts and shipments of grain very light. The majority of mills continue idle. No. 2 Milwaukee Soft wheat $1.31; No. 3 Milwaukee, $1.11½. Corn firm, No. 2, 61c. Oats higher, No. 2, 43½@44c. Rye, 97c. Barley No. 2, Spring 97c.....St. Louis, Mo.—Excellent weather during the past week has enlivened all sorts of business. Provision market beginning to show strength. Packing hogs have sold slowly on account of warm weather; but the present cold weather has made the hog trade brisker. Cattle market still dull. Grain is tending upward and flour is a trifle higher. Tobacco very quiet. Prices compared with last year's are good. A few comparisons:—Twelve months ago medium, wrapping leaf tobacco was worth $9.50@$12.50; now it sells for $15@$18. Choice flour stood at $4.90@5.05; now it brings $6@$6.25. No. 2 white mixed corn brought 39c. then; now, 65c., and a few weeks since 71½c.@72c. No. 2 red wheat was then sold at $1@$1.02; it sells now at $1.34 and has been higher. No. 2 oats then, 29c.; now, 44½c. Mess pork then, $14.25; now, $17.25. Creamery butter then, 30c.@32c.; now, 36c.@37c. Potatoes then, 45c.@50c.; now, $1.15@$1.20 per bushel. Shipping steers the same now as then. Choice mutton sheep then, $3.50; now, $4.50. Packing hogs then, $4.65; now, $6.10.....Minneapolis, Minn.: Weather a decided improvement on that in any former week in two months. Ground frozen solid and country roads in fine condition, causing a free movement of country produce. Condition of wheat in elevators unsatisfactory. A large percentage will not inspect at as high grade as the receipts issued. Calls for heavy losses will fall on somebody, owing to lax inspection when received and damp weather, which prevented curing in store. Buyers refuse to purchase warehouse receipts. Good, sound wheat in demand. Other produce moving freely at high prices. An increased number of hogs are being marketed at high figures, and these sales with others put a great deal of money in the hands of producers. Flouring mills more than two-thirds shut down, reducing the daily production of flour to about 8,000 barrels. At 4 o'clock yesterday (Sunday) morning a fire broke out at the Pillsbury flouring mill, destroying that as well as the Excelsior, the Minneapolis and the Empire mills, together with a cotton mill. Capacity of the burnt mills, 2,500 barrels a day; that of all the mills here, 25,000 barrels a day. Total loss about $416,000. Four men certainly killed and at least five severely hurt.....

It is useless to groan with rheumatism when a bottle of St. Jacobs Oil will cure it, as everybody knows.—Columbus (Ohio) Daily Times. —*Adv.*

Prof. Horsford's Baking Powder.

M. H. HENRY, M. D., the celebrated family physician of New York, says: "The use of Prof. Horsford's Baking Powder, offers admirable means for the introduction of a valuable element into the system, with the food of every-day life.—*Adv.*

Why are you Bilious?

Because you have allowed your bowels to become costive, and liver torpid. Use Kidney-Wort to produce a free state of the bowels, and it will stimulate the liver to proper action, and cause new life in the blood.—Hawkeye.—*Adv.*

Lydia E. Pinkham's Vegetable Compound will at all times, and under all circumstances, act in harmony with the laws that govern the system. Address Mrs. Lydia E. Pinkham, 233 Western Avenue, Lynn, Mass., for circular.—*Adv.*

A Pure and Effective Hair Dressing.

COCOAINE, a compound of Cocoanut Oil, beautifies the hair and is sure to allay all itching and irritation of the scalp.

The superiority of BURNETT'S FLAVORING EXTRACTS consists in their perfect purity and strength.—*Adv.*

The Markets.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Dec. 3, 1881.

BEANS AND PEAS.—Standard white beans have taken an upward move again and a fair rate of trade is reported. Good lots of foreign beans are coming. German are quoted regularly at $2.65@2.75. Some Italian and Russian stock was showing; peas of all kinds above steady.

Peas, green, prime, in bbls., $1.65@1.70; green, fair to good, $1.40@1.60; Southern b. c., per 2-bu. bag., $3.15@3.50.

Beans, marrow, prime, $2.45@2.50, fair to good, $3.25@3.35; medium, choice, $3.15@3.20; fair to good, $2.75@3.00; pea, choice, $3.20@3.25; fair to good, $2.90@3.00; white kidney, choice, $3.40; good, $3.20@3.30; red kidney, choice, $2.85@2.90; fair to good, $2.50@2.75; turtle soup, $1.75@1.80.

Receipts of beans for the week, 8,000 bush.
Exports do. 235 bbls.

BUTTER.—Prices settled into a very strong position early in the week, and choice and fancy grades have ruled quick at the advance. High rates have perceptibly enlarged the receipts and sellers' look upon the next few days as a test period for the endorsement of the new scale. There are reputable dealers who predict a dull December unless prices break into more popular ranges. Retailers complain that their business does not show the volume it should at this date.

Creamery, extra choice Elgin and Iowa, 41@42c.; good to prime, 37@40c.; fair to good, 33@36c.; poor, 20@25c.; sweet cream, fresh, 34@36c.; State dairy, half tubs and pails, ch. fresh, 35@37c.; good to prime, 32@34c.; fair to good, 28@32c.; Welsh tubs, choice fresh, 34@36c.; good to prime, 31@33c.; fair to good, 27@31c.; poor to fair, 20@25c.; State dairies, firkins and tubs, choice, 32@33c.; good to prime, 29@30c.; fair to good, 27@29c.; firkins, dairies, choice, 31@32c.; good to prime, 28@30c.; fair to good, 25@28c.; poor to fair, 18@25c.; Western imitation creamery, 30@36c.; dairy, fresh, choice, 32@34c.; good to prime, 27@32c.; fair to good, 20@27c.; factory, late made, choice, 25@28c.; late made, good, 16@18c.; fair, 14@15c.; Iowa, fine June, 16¼@17c.; Ohio and Ind., June, 15½@16½c.; June, fair to good, 15@15½c.; factory, very poor, 13@14c.; roll butter, good to prime, 24@26c.

Receipts for the week, 31,450 pkgs.
Exports do. 1,900 do.

CHEESE.—Early in the week the market was animated by a number of sales to exporters but prices even for best late marks had to be named as extreme. Fine stock is scarce; an unusual supply of stock—weakened cheese has come forward, and the fact has intensified the noted dullness of the past.

State f't'y, fine, Sept. 12¼@12¾c.; good to prime, 10½@11½c.; fair to good, 9½@10¾c.; poor to fair, 8@9c.; Ohio factory, flat, fine mild, 11¾@12c.; good to prime, 10@11c.; fair to good, 8@10c.; poor to fair, 6½@8c.; creamery, partly skimmed, choice, 8@8¼c.; poor to fair, 4@6c.; creamery, partly skimmed, choice 8@8¼c.; export styles 5@6½c.; skimmed 2¼@3c.

Receipts for the week, 70,329 bxs.
Exports do. 41,030 do.
Liverpool cable 63s. 6d.@65s.
Steam to Liverpool, 55@63s. for Summer to Fall makes.

COTTON.—The week has been a fluctuating one, but there have been no violent reactions, the sway being from 2 to 5 points and closing prices show some gain for the week.

CURRENT PRICES FOR SPOT COTTON.

Quotations based on American standard of classification and on cotton in store, running in quality not more than half a grade above or below the grade quoted.

Average of futures:—
December, 12.07c.; January, 12.25c.; February, 12.44c.; March, 12.63c.; April, 12.80c.; May, 12.91c.; June, 13c.; July, 13.09c.; August, 13.19c.; October, 11.85c.
Receipts for the week, 81,107 bales.
Exports do. 13,180 do.

DRIED FRUITS.—For apples the tendency is lower, and holders would be willing to meet buyers on lower bids for either evaporated or sun-dried. Peaches are in few hands and nominally firm. Small fruits are steady.

Apples, evaporated, rings, f'y 14c.; fair to prime, 12@13c.; N. C. new, sliced, fancy, 7¼@8¼c.; fair to choice, 6@8c.; Southern quarters, choice, 6@6¼c.; Southern, fair to prime, 5¼@6c.; do. ordinary, 5@5¼c.; State, old, fine cut, choice, 6¼@6¾c.; quarters, do. 6@6¼c.; small lots, 6¾@6¾c.; Ohio and Mich. choice, 6¼c.; Western, fair to good, 3¾@6¼c. Peaches, evaporated, peeled, old, 35@37c.; unpeeled, new, 16@17c.; N. C. peeled, fancy, 23@24c.; choice, 22@—c.; Ga. 21@22c.; Southern, peeled, fair to good, 18@20c.; unpeeled halves, 6¾@7c.; halves, Tenn.——c.; quarters, 6¾@6¾c.; Plums, State, black, 17@17½c.; Southern Damson, 14c. Blackberries, 13c. Cherries, Southern, dry, 18@19c. Raspberries, pr 28c. Huckleberries, pr 14½@15c.

EGGS.—Receipts for the week, 7,008 bbls.; do. last week, 12,235 do. Supplies are light, and there is enough demand to keep prices firm, especially for strictly fresh parcels. There is also a good use of stored fresh and reliable limed stock.

New J'y L. I. and near by 34@35c.; Pa. and State fresh, 2½@33c.; Western fresh, 30c.; Western and Canadian held, prime, 28@28½c.; other, 24@27c.; State, limed, 24c.; W. and Canadian 21½@23½c.

FLOUR.—Low or export grades have been wanted all the week at better prices, but such low lines have shown liberally in the receipts. High grades are fairly plenty and not specially changed.

No. 2, $3.75@4.75; State and Western, superfine, $4.50@5.25; city mills, XX, $5.40@7.35; Spring wheat, extra, $5.25@5.60; Spring XX and XXX, $5.65@6.75; patents $6.50@8.50; Ohio round hoop shipping, $5.20@5.90; trade brands, $5.00@5.50; St. Louis extra, $5.50@6.00; do. double extra, $6.20@6.50; do. family, $6.60@7.00; Southern extra shipping, $6.00@6.40; do. XX and family, $6.50@7.25. Rye flour, superfine, $4.50@5.30; buckwheat flour ₱ 100 lbs. $3.75@4.00. Corn-meal, Brandywine, ₱ bbl. $3.75@3.85; do. Western, $3.35@3.75. Wheat feed, 40 lb ₱ ton, $19.00@20.00; 60 lb ₱ ton, $19@20; 100 lb ₱ ton, $22@23.

Receipts of flour for the week, 97,013 bbls.; corn-meal 2,660 do.
Exports of flour for the week, 72,150 bbls.; corn-meal 4,275 do.

FRESH FRUITS.—Exports of apples for week, 4,300 bbls. Choice apples are firm, and few would be released from store at the quotations. Common lots slow and cheap. Cranberries rule strong. Florida oranges improving in quality.

Apples, Spitzenburg, ₱ bbl. $3.50@4; Greening, fancy, $3.50; Baldwin, do. $3.50; Baldwin, Greening and Spitzenburg, fair to prime, $3@3.25; mixed lots, State prime, $2.75@3.25; do. fair to good, $2.25@2.75; seconds, $1.75@2. Pears, Boston, bush. boxes, poor to good, $1@3.50; Lawrence, State, ₱ bbl. $2.50@4.00; Vicar of Wakefield, $2.50@3.50; cooking, $2@3. Grapes, Catawba State, case of 18 3-lb. bxs, 3.50@$4; bskts, ₱ lb. 7@8c.; Isabella, State bskts, 3@3½c. Florida oranges, half bbl. bxs, choice, $3.75@4; good to prime, $3@3.50; inferior, $2@2.50; thirds, choice, $2.75; fair to prime, $2.25@2.50; inferior, $1.50@1.75. Cranberries, Cape Cod, fancy, large, ₱ bbl. $11@11.50; good to choice, $9@10; poor to fair $6@8; ₱ crate, $3@3.75; New Jersey fancy, $3.12@3.25; fair to prime, $2.50@3; poor to fair, $2@2.50; frosted, 50c.@$1.

Peanuts, Va., hand-picked, ₱ lb, 6¾@7c.; fancy, 6¼@6½c.; extra prime, 6@6¼c.; good to prime, 5½@6c. shelled, 5@6c.; pecan nuts, 10½@11¼c.; hickory, shellbark Northern, ₱ bu. $1.00@1.12; Western, $1.00; bull nuts, 40@50c.; black walnuts, 50@60c.

GRAIN.—Quite a steady export demand for wheat has prevailed and prices are higher at the close. The market obtains some strength, as well by the strong "bullish" feeling at the West and moderate receipts at this point. Corn has had an active trade for export and with contracts to be covered for November prices are of an upward tone. Oats strong and active.

Wheat, Spring, $1.23@1.39; Spring No. 2, $1.32@1.38; red Winter No. 2, $1.41½@1.42½; red Winter, $1.33@1.38; white Western and State, $1.35@1.42. Rye, 96c.@$1.01. Oats, white No. 1, 53¼c.; No. 2, 51½@51¾c.; No. 3, 50c.; mixed, No. 1, 49½c.; No. 2, 49¼c.; No. 3, 47@48½c. Corn, Western, mixed, 66@71c.; do. No. 2, 70½@71c. yellow, 70@73c.; white, 71@76c. Barley, Canada, No. 1, $1,10@1.12; do. "bright," $1.14@1.15; State, 4-rowed, $1; 2-rowed, 86c. Buckwheat, 95@98c.

Receipts for the week, wheat, 696,332 bush.; corn, 780,488 do.; oats, 193,146 do.; rye, 71,000 do.; malt, 62,330 do.; barley, 448,000 do.

Exports for the week, wheat, 639,650 bush. corn, 791,300 do.: oats, 1,600 do.

HAY AND STRAW.—Exports for week 3,450 bales. The market is lower. Receipts of hay by boat and rail have been excessive and a large stock is accumulating. Better trade and firmer may occur after the close of navigation. Straw steady.

Prime Timothy hay, ₱ 100 lbs., $1.05@1.10; medium Timothy, 80@95c.; shipping grades, 65@70c.; clover mixed, 70@80c.; all, 60@65c.; Straw, long 75@80c.; short 55@60c. oat and wheat straw, 45@50c.

HONEY.—Demand moderate. Strained honey quoted at 9@10c. for white, pure, and 7@8c. for dark.

White clover, fancy, 1-lb bxs, ₱ lb, 19@20c.; do. 2-lb bxs, 18c.; good to choice, 16@2-lb bxs, 15@17c.; buckwheat, 1-lb bxs, 14@15c.; 2-lb bxs, 12@14c.

HOPS.—The Producers' Price Current says: "The market is decidedly dull; brewers continue indifferent and exporters are not in the market. Some lots are arriving on commission and offering at current rates but cannot be sold without naming concessions. Some lots of German hops arrive and as the continental markets are reported lower there is some apprehension of farther considerable arrivals. London mail advices to Nov. 15 report strictly choice American in small supply and fair demand; £8 8s. obtained in a few rare instances. Shipments of strictly choice are advised, and of sound useful low grades to be used in place of old, which are very scarce. Grades a little below choice will, it is thought, find slow sale."

Crop of 1881, choice, 28c.; good to prime, 25@26c.; fair to good 22@25c.; eastern, 18@26c.; 1880, good to prime, 18@22c.; poor to fair, 10@15c.; 1879 fair to prime 7@15c.

Receipts for the week, 1,767 bales,
Exports for the week, 419 do.

MILK.—Sales of commission milk have again ruled steady at very good prices. The average was $2.93 per can of 40 quarts; sales largely at $3 per can.

POULTRY AND GAME.—Supplies of dressed poultry have been fairly abundant, but not of a quality to promote quick sales. Prices are lower for all lots, Western showing the weakest range. Settled cold weather is needed, however, to give snap to trade, as stock will unpack more attractively.

Turkeys, Phila. pr, 15@16c.; Jersey pr, 13c; State and W'n pr, 11@12c.; f'r to g'd, 10@11c. Chickens, Phila. prime, 14@15c.; Bucks Co. do. 13@14c.; Jersey, do. 12@13c.; State and Western, do. 10@11c. Fowls, Phila. prime, 13c.; Bucks Co. 11@12c.; New Jersey, do. 10@12c.; State and Western, do. 9@10c.; fair to good, 8@9c.; inferior, 8@9c. Ducks, Phila. prime, ₱ lb, 14@16c.; Jersey and Bucks Co. 13@14c.; State and Western, 12@13c; fair to good, 10@11c. Geese, Phila. dry-picked, prime, 12@13c.; Jersey and Bucks Co. 11@12c.; State and West'n, 10@11c.; fair to good, 8@9c. Squabs, white, ₱ doz. $2.50@2.75; dark, $1.50@1.75.

Live poultry hardly pays for transportation. The supply has run large; high corn perhaps induces many to thin out coops.

Chickens and fowls, J'y, State and Penn. ₱ lb 9@10c.; Western and Southern, 8@9c. Roosters, old, 5c. Turkeys, Jersey and Penn. 9@10c.; Western, 7@9c. Ducks, Jersey, extra-large, ₱ pair, $16@1.25; Jersey, New York and Penn. 60@75c.; Western and Southern, 45@75c. Geese, Jersey, $1.50@2; N. Y. and Penn. $1.25@1.62; Western mixed, $1@1.37. Pigeons, 20@30c.

Canvasback duck, Havre de Grace $2.75; choice Western, $2.50; Norfolk, $2.25@2.50; redhead 80c@$1 for Western and 50@75c. for Norfolk. Mallards are seldom good enough to exceed 40c, but a few choice go up to 75c. Blue winged teal are quoted at 40@50c. green winged at 35@40c, and common ducks at 25c. all per pair. Rabbits in good demand; a few choice Jersey sold at 50c. Venison in fair demand and steady.

Quail, choice, ₱ doz. $1.75@2.00; inferior, $1.25@1.50; grouse, choice, ₱ pair 87c@$1.00; soft, 65@75c.; partridges, State and W'n, pr. 87c@$1.; Eastern & Minn 85@87c.; soft, 65@75c.; woodcock, choice, 75@87c.; inferior, 65@75c.; rabbits, 40@45c.; venison, Minn. short saddles, ₱ lb. 17@18c.; State & Wn, 14@16c.; whole deer, 11@12c.

PROVISIONS.—Quotations for hog products are on a good foundation there being free shipments abroad of both lard and bacon. The Cincinnati Price Current estimates a decrease of 1,000,000 lbs. of pork for this year compared with the packing of '81.

Pork, prime mess, ₱ bbl. $16.75@17; extra prime, ₱ bbl. $14.25@14.50; Western mess new, $17.75@18.00. Lard, steam Western, ₱ 100 lbs., $11.10@11.45; prime city, $11.80@11.35. Hams, smoked city, ₱ lb. 12½@13c.; pickled Western and city, 9¾@10¾c.; Shoulders, smoked city, 8¼@8½c; pickled, 7½@7¾c. Rib bellies, pickled, 9¼@9¾c. Bacon, long clear Western, 8¼@9¼c. Beef, Western mess, ₱ bbl. $12; packet, $11.50@15.00; India mess, ₱ tcs. $24.00@27.00. Beef hams, ₱ bbl., $21.00@21.50.

Receipts for the week—Beef, bbls. and tcs. 2,350; pork, bbls. 8,830; cut-meats, pkgs, 33,220; lard, do. 15,150.

Exports for the week—Beef, bbls. and tcs. 2,100; pork bbls. 3,823; cut meats, lbs. 5,083,662; lard do. 4,291,478.

RICE.—Quotations are:

Carolina, choice, 7¾@8c.; good to prime, 7@7¼c.; common to fair, 5¾@6¾c.; Louisiana, good to prime, 7@7½c.; low fair to fair, 5¼@6¼c.

SEEDS.—Clover is held about ¼c. higher, but moves very slowly. Dealers ask about ¼c. above quotation for lots selected for export but make little progress in selling.

Clover, Western, 1881, car lots on track, 8¼@9c.; Timothy, job lots in store, $2.85@3.25; Flaxseed, American, rough, ₱ bu, $1.62½@1.65.

SUGAR.—We quote as follows:

Crushed, per lb, 10c.; powdered, 9¼@10c.; granulated, 9¼c.; cut loaf, 10c@10¼c.; confectioners' "A," 9¼c.; coffee "A," 9¼@9¼c.; off "A," 8¾@9c.; white extra "C," 8¾@8¾c.; extra "C," 7¾@8¼c.; "C," 7⅛@7¼c.; yellow, 7@7¼c.

VEGETABLES.—Exports of potatoes for week 1,801 bbls. Receipts of potatoes are light and prices are firm for choice. Under grades slow as many are in stock.

Potatoes—Early Rose, N. S., ₱ d.-h. bbl., $2.75@3; State, $2.75@3.00; bulk, ₱ bbl. $2.62@2.87; Prolific, N. S. per d.-h. $2.62@2.75; bulk ₱ bbl. $2.50@2.75; Snowflake, State, ₱ d.-h. bbl. $2.75@2.87; bulk, ₱ bbl. $2.62@2.75; ₱ d.-h. bbl. $2.75@3; bulk, ₱ bbl. $2.62@2.87; Burbank, d.-h $2.75@3; bulk, ₱ bbl. $2.62@2.87; Peachblow, ₱ d.-h. bbl., $2.75@3.00; Peerless, bulk, ₱ bbl., $2.25@2.50; Mercer P. E. Island ₱ bbl. $1.75@2.25; sweet potatoes, Va. yellow, ₱ bbl. $4@4.25; Del. River, pr. $1.50@4.75; Jersey, ₱ bbl. $3.75@4.00; inferior, $2.50@3.50.

Onions steady but rather quiet. Squash scarce and firm. Cabbage selling high when of choice quality. Cauliflower very irregular.

Onions, white bulk, ₱ bbl. $3.00@4; yellow, $2.25@2.50; red, east, $2.25@2.50; red Chester, $2@2.37; squash, Marrow, ₱ bbl., $1.00; Hubbard, $1.00; cabbage, ₱ 100, $8@18; beets, L. I. ₱ bbl. $2.25@2.50; carrots, $1@1.25; turnips, Russia, L. I. $1.75@2; Canada, $1.50@1.62; cauliflower, fancy, $5@7; average quality, $1.75@2.50; inferior, 50c@$1; celery, ₱ doz., $1.75@2.00.

WOOL.—The market is only moderately attended, some of the chief manufacturing buyers indicate that they will wait until New Year opens before they will carry larger stocks.

LIVE STOCK MARKETS.

NEW YORK, Saturday, Dec. 3, 1881.

BEEVES.—Receipts for the week, 12,460 head; do. last week, 13,192 do. Sales have been large during the week and the close was a dragging one. Some 21 car loads of Texans and Colorados sold at 7½@8¼c. to dress 55 lb, and very common to choice native steers took the range of 7¾c. to dress 55 lb to 12½c. to dress 57 lb. Cattle for export are slow; the passage at this season is apt to be rough and detrimental to the quality of the beeves.

MILCH COWS.—The demand is good at a very paying range—$10@80 ₱ head.

SHEEP AND LAMBS.—Receipts for the week, 48,920 head; do. last week, 33,125 do. The retail meat markets are dull. The small business reported up to noon was 3¼@5¼c. for poor to prime sheep and 5@6½c for poor to very good lambs. The offerings con-

tain many culls which farmers wish to avoid wintering.

SWINE.—Receipts for the week, 33,467 head; do. last week, 37,134 do. Live steady at full rates.

Hogs, New Jersey dressed, light, 8½@9c.; medium, 8@8½c.; heavy, 7½@7¾c.; city dressed, 7¾@8c. Live hogs, corn-fed, ₹ 100 lbs, $6@6.50. Pork tenderloins, ₹ lb, boxed, 11½@12½c.

VEAL CALVES.—Supplies of dressed are more liberal and prices are not so stiffly quoted for live.

A 32 CALIBRE $10.00 REVOLVER FREE TO EVERY READER OF THIS PAPER.

READ THIS

About a month ago we made an offer through the Newspapers of a **32-Calibre BLUE JACKET Revolver,** and a subscription to the **"HOUSEHOLD GUEST MAGAZINE"** FOR ONE YEAR, for the then unheard of LOW PRICE of **$2.00.** We had 5,000 of the 32-Calibre **BLUE JACKETS** nearly all of which have been sold, (or rather given away). They have given such universal satisfaction, and we have received so many high Testimonials, together with thousands of calls for a heavier calibre revolver that we have decided to offer our **World Renowned 32-Calibre BLUE JACKET** for a **limited time** FOR THE LOW PRICE OF **$3.50. The 32-Calibre BLUE JACKET** IS WITHOUT EXCEPTION THE MOST ELEGANT AND BEAUTIFULLY FINISHED REVOLVER IN THE WORLD. Every Revolver is Guaranteed in every respect. They are made of the finest steel. The barrel and frame are finest **Nickel silver-plate,** and the Cylinder and Base Pin are of the **Finest Gold-plate.** Every Revolver is BEAUTIFULLY ENGRAVED. The engraving is then BEAUTIFULLY ENAMELED in blue by a patent process, owned by us. The frame near the handle is set in imitation of **beautiful rubies,** making a contrast of **GOLD, SILVER, BLUE and RUBIES,** which taken together with the **IVORY HANDLE** make it simply BEAUTIFUL BEYOND DISCRIPTION. **It must be seen to be appreciated.** No pen can picture its beauty or describe its actual merits. The name **BLUE JACKET** is enough to stamp it as a first-class weapon in every respect. It has the **New Russian Model Hip Stock** exactly fitting the hand, enabling one to hold it firmly and steadily. We Guarantee its Shooting Qualities equal to a SMITH & WESSON OR COLT, and for beauty and durability it cannot be equaled. The Cylinder is provided with a Positive Stock Action holding it firmly in place. It uses the Long 32-Calibre Cartridge making it one of the Strongest Shooting Revolvers in the world. It is the special terror of burglars, highwaymen and tramps. We pledge our reputation that it is the first **32-Calibre Ivory Handle Engraved, Nickel and Gold-Plated Revolver** ever sold for **less than $10.00,** and the ENAMELED and RUBY FINISH Is the FIRST EVER SEEN ON ANY REVOLVER. We purchased these Revolvers partly finished at less than the raw material cost and had them finished as above described for this special purpose, and we hereby **Guarantee over our own signature to refund money** for each and every Revolver found to be different from what we represent it. **FOR THREE DOLLARS and FIFTY CENTS, and TWENTY-FIVE CENTS** extra to help to pay postage and packing expenses, We will mail this Revolver to any part of the world, and in addition will enter your name on our Subscription Book for a year's subscription to OUR MAMMOTH PUBLICATION, **THE HOUSEHOLD JOURNAL.** The Journal contains **24 Large Pages, filled with Illustrations, Stories, Sketches, Adventures, Poetry, Anecdotes, Farm and Garden Statistics, The News, Etc.** This offer HOLDS GOOD ONLY TILL **MARCH 1st, 1882,** or until our stock is sold out, after which time we shall be obliged to charge more than double what we do now. Should our stock run out before THAT DATE, WE CLAIM THE RIGHT AND PRIVILEGE of returning your money. As we have only **Ten Thousand,** we would advise you to order now, as past experience teaches us that they will soon be sold. **FREE TO ANY ONE.** We will give this Revolver FREE to **any reader of this paper** who will **CUT THIS ADVERTISEMENT OUT,** show it to their friends and get six orders at **$3.75** each. After you have done this send us **$22.50** the price of Six Revolvers and we will send you one Revolver and a subscription to **THE HOUSEHOLD JOURNAL FREE FOR YOUR TROUBLE,** and each one in your club will also receive the Journal a year. **THE BEST WAY** is to order one for yourself first and show it to your friends, you will then find it easy to get others to order, or if you desire to speculate, you can easily sell these Revolvers for **$10.00** each. As to our reliability we refer to any Commercial Agency, newspapers, Publishers, or Express Companies in New York City. If this is not sufficient, write us for references which we will cheerfully furnish. Send all Money by REGISTERED LETTER or POST OFFICE ORDER at our risk. When one or more are ordered by Express, at **$3.75** we put in a Box of Cartridges with each Revolver.

The Fair Number of the **Rural New-Yorker** *(44 pages), which contains a full description of our* **Free Seed Distribution for 1882,** *also an account of the* **$2.000 worth of Presents** *offered to those subscribers who produce the best yields, and our Premium Lists for all who interest themselves in securing subscribers for the Rural New-Yorker, will be sent free to all applicants. Our new Posters are also ready and will be sent free to all. Our friends and agents are reminded that the present is, on many accounts, a more favorable season for securing subscriptions, or the promise of them, than later, when competition is keener.*

The Rural New-Yorker is for the North, South, East and West.

It knows no sectional prejudices. Everybody who is interested in a garden, vineyard, orchard or farm; in new plants, in farm or garden implements; everybody who is interested in Horticulture, and seeking through such means to increase the happiness of life and home, should subscribe. The Rural New-Yorker is the earnest friend of all who love nature and her works.

The first journal to have established an Experimental Farm conducted in the interests of its readers.

The Rural New-Yorker is acknowledged, by those who should know, to have worked a new era in rural journalism. Five Hundred Illustrations from nature annually; the best writers; the best draughtsmen Ask those who know.

Horses, Cattle, Sheep, Swine, Poultry,

Milk, Butter, Cheese, Diseases of Animals, Bees, Injurious Insects, Grain, Grass, Small Fruits, all Ornamental and Useful Trees and Shrubs are among the prominent subjects treated in its columns.

No matter where you live, you cannot afford to be without the Rural New-Yorker. It is the progressive, aggressive, alert, original, conscientious rural journal of the age. Thousands of testimonials to this effect. Our **Everywhere Reports** are invaluable to the Farmer and Horticulturist. They have proven of great value to them in determining the best time to **Buy** or **Sell.** Our market reports are corrected by a special reporter up to the time of going to press. Our agricultural and general news embraces everything of interest to intelligent readers. Correspondents everywhere. Thirty-second year of its age: Fifth year under its present management. Try it—*Try it*—TRY IT—for one year. It will cost you but $2.00. It may save you hundreds. Try it as a measure of Economy.

The objects of the Experiment Farm of the Rural New-Yorker are to test all kinds of new seeds and to present the results to our readers; to produce new varieties of grain by cross-breeding; to test new farm implements and methods of culture, with a view to producing the greatest yields at the smallest cost; to disseminate seeds of varieties which, from our own tests, have proven of unusual worth among our readers, without cost to them, and thus advance the agricultural interests of the whole country.

The Progress and Development of American Horticulture and Agriculture

are always our earnest endeavor. Such efforts as these have brought the Rural New-Yorker to the position it now occupies. The Price of the **Rural New-Yorker is reduced to $2.00 a Year,** payable *invariably in advance.* We have now no club or second price. It is alike to all. ☞ Send for the Fair Number which explains all.

Address RURAL NEW-YORKER, 34 Park Row, New York.

For the Young.

REGULAR DISCUSSION
OF THE
Youths' Horticultural Club.
OF THE RURAL NEW-YORKER.

TOPIC: "Winter Flowers for the Parlor; How and What to Cultivate."

THE third monthly meeting of the Horticultural Club was called to order, Uncle Mark in the chair. He remarked, concerning "Winter Flowers," that no home was quite complete in Winter without the presence of beautiful plants and flowers. How much we enjoy them in the Summer time, when every breeze is laden with their fragrance, but if we can keep with us, through the cold and snowy Winter, these reminders of Summer days, how much more their beauty and fragrance delight us. They cheer us when the wintry blasts beat hard against the window pane, and without them one charm of home is gone. But if the plants are weak, straggling and infested with insects, the effect they have on us is quite different. We are apt to kill our Winter flowers with kindness. We are to study the precise needs of each plant to ascertain how much of light, or water, or heat they require, and by so doing we shall have the best success. Let us remember that—

"The careful florist tends his sheltered plants,
Studies their natures, and supplies their wants."

The geranium (properly pelargonium) is one of the most satisfactory of Winter flowers. It requires only a little sun and a temperature of over 60° to bloom incessantly. But to do this it must be "slipped" in Summer, or the old plants potted in August. There have been great improvements in this plant within the last ten years. We now have double flowers from white to rose, to maroon, while many of the single kinds bear flowers of the most exquisite shades.

EDDIE GUFFIN.—We have quite a number of plants for this Winter, such as geraniums, verbenas, cannas, pinks and others. We have them in south windows where they have plenty of sun aud light. We water them once a week thoroughly, and occasionally give them a good washing with warm water; at times we find little white worms in the pots among the roots, then we give them fresh soil or sometimes stick some matches around the plants which seem to help them a good deal. Our plants are all looking very well now, and we hope they will be a pleasure to us this Winter.

OSCAR CHAPMAN.—I think the following plants are nice for Winter cultivation: The Wax plant is well worth the time one will have to wait to see it bloom from cuttings. We do not cut a bloom often for the old burr blooms year after year and grows larger. Smilax is grown from seed by keeping the soil moist. The Asa Gray Geranium we all know and love. In our yard there was a bush, one foot high, that had in September 18 clusters of blossoms, and buds, not expanded, at one time, and in October thirteen more and it is now full of blossoms. We have several for Winter blooming; mamma says they give double the bloom of any other variety she has. Our Winter blooming plants have just commenced to bud. Some have their first clusters just opening, having been carefully repotted for the second time, about six weeks ago. We do not let our Winter plants grow in the yard but give them rest, as we call it, in boxes and keep the buds picked off. We have a Justishus Cactus (budding now) lantannas, geraniums, a Lemon Verbena, etc.

THE CHAIRMAN.—We should bear in mind that geraniums bear seeds plentifully in the house. If these seeds are planted at once, they will sprout in two weeks and produce flowers next Summer. Abutilons are splendid Winter flowers. They will thrive well in the same window with geraniums and bloom almost incessantly.

IDA DEMAREST.—We have many kinds of Winter flowers but I think the different varieties of pelargoniums, including those with handsome foliage, also callas, heliotropes, and a few vines of ivy make the best plants for Winter, and they are easily cultivated.

LIZZIE ABDILL.—My knowledge of the care of flowers is rather limited, but I have a nice stand full in my room aud I intend to Winter them unless old Jack Frost thinks they would look prettier with a coat of silver dust upon them. We covered the earth in our flower pots with moss from the woods. Never put flowers near a window, unless you want them to freeze. We found that out last Winter. We think it is best not to keep the earth very wet arouud the flowers when it is extremely cold as the frost will be sure to find the water at the roots of the plant. But water them enough—not too much. Our assortment consists of geraniums of different sorts, a tuberose, a cactus, dianthus and carnations and a lovely plant called The Forbidden Fruit.

THE CHAIRMAN—The surface soil of the pots should be stirred often. It should not be allowed to become solid or soggy. This is evidence that the pots are not well drained, and there are no plants—except, perhaps, Calla Lilies—that will do well unless the drainage is perfect. A sandy loam or leaf-mold is best for window plants. If such a light, porous soil is used, and the drainage is good, there is little chance of watering them too much.

"QUINNIPIAC"—As to "Winter Flowers for the Parlor," if I could have but one plant, the Calla would be that one. It blossoms better than anything else with me, where our plants have to fight against gas and furnaces. I let the roots dry up through the Summer and in August pot them in fresh soil and water well, and they soon start and grow finely. But we have other plants besides the Calla. I think the hyacinth is a good plant for city homes. I pot mine about the middle of September and then place them in the cellar, where it is dark and cold, for about two months, or until the roots have made a growth to the bottom of the pots. It is very interesting to me to watch them grow after they are brought out into the warmth and light. They blossom well for two years, but after that I place them out-of-doors in the border. I have grown crocuses in the same way as the hyacinth, and have tried tulips, but never had very good success with them. Another fine plant for winter-blooming is the geranium in its different varieties. I usually take off slips from the old plants in August and root them in sand. I think a great many persons wait too long before they think of making cuttings, and when cold weather comes on they are not ready for it. They then have to take cuttings which will not bloom until the next Spring or Summer, or else take up the old plants, which surely will not do well. But if cuttings are taken and rooted in August they will be just getting ready to bloom when cold weather comes. Right here I wish to say that I saw some cuttings rooted in nothing but damp saw-dust There are many other plants which are useful for Winter-blooming, such as primroses, fuchsias, etc., but I like only two or three kinds, and these well-grown, rather than to have a window full of poor-looking things. I have also a very nice fern-case that I arranged myself, and feel quite proud of it; also an English Ivy about eight feet long, trained on the side of the room.

THE CHAIRMAN—As a moist atmosphere and equal temperature cannot be easily preserved in the sitting-room or parlor, it is useless to attempt to cultivate the rarer, tenderer plants. Bouvardias are easily cared for, and bloom continually; so do fuchsias. Among vines the smilax and ivy should not be forgotten. Among broad-leafed plants the India Rubber tree is one of the best. Its tropical aspect lends a peculiar beauty to the greenhouse.

C. A. BUTTERWORTH—No one can be successful in the cultivation of plants, as the chairman has said, who does not study their wants and adapt things, as far as possible, to the conditions favorable to their growth. Persons who are not very familiar with flowers should select those which are not very tender and which are free-blooming. Young, vigorous plants give more satisfaction than those which have outgrown their thrifty youth, and have become too unwieldy to handle with ease. Plants which can stand a dry atmosphere and high temperature are best suited for in-door culture. A rich, sandy loam is probably the best for plants in general, and this, with sunlight and judicious watering, will usually insure plenty of flowers, that is, not omitting pure air, which is as necessary for plants as for animals.

THOMAS WINFREY—Tulips, hyacinths, crocuses and many others are nice for window gardening. Tulips should be planted about the last of October or first of November, in five-inch pots, about five bulbs to each pot. Use sandy soil and cover one inch. Place in a cool cellar. When started they should be placed in a cool, light window. Hyacinths, for glass culture, start in damp sand, in a warm closet; then transfer to glasses, and place in a light room. Crocuses may be planted in pots with tulips and other flowers.

THE CHAIRMAN.—Unless there is plenty of sunlight and a growing temperature is maintained, it is best not to manure potted flowers. A scanty diet is best for plants that live under unfavorable conditions. Only those that are in a vigorous, healthy growth will be benefited by a strong diet. Lime water is good for most plants as it sweetens the soil.

JOSIE MARQUIS.—Our plants are few and common, but we think none the less of them on that account. We have different colors of both double and single geraniums. I have a "Pearl" tuberose that I got last Spring, but it hasn't bloomed yet. My favorite is the fuchsia, but ours were killed last Winter. My brothers say they like geraniums for they are the hardiest. Sister has two varieties of ivies, hardy and parlor ivy. In the Fall we let the soil get dry and set them in a cellar and do not water. In the Spring we set them out in the sunlight and not one in 10 fails to grow again. When the soil gets too wet and that little white wire worm gets to working at the roots, a weak solution of tobacco water is the best remedy that we ever tried and the best use for tobacco, too. What is a good remedy for green flies and the mealy bug?

THE CHAIRMAN.—Tobacco smoke is good (or bad) for the green flies, or aphides so prevalent in Winter plant houses. Care must be taken or this will injure the leaves of many species. The mealy bug is the worst pest of all. It is quite as well to throw an infested plant away as to try to exterminate these bugs. Alcohol, applied with a camels-hair brush will kill the bugs with which it comes in contact. If the air is too moist, the green fly will appear; if too dry, look out for the red spider.

CLARE BRAMHALL.—The collection of plants that we want is one that will give the most flowers in the Winter under ordinary accommodations or treatment. Chrysanthemums usually do well and come into bloom when there is the greatest scarcity of flowers, and for a display of flowers in the Winter, lantanas, pyrethrums, heliotropes, primroses, abutilons and callas, with young plants of fancy leaf geraniums. Verbenas, fuchsias, double and single petunias are among the best. Do not forget a hanging basket of oxalis—it will brighten the window all Winter. Add a few vines and scented geraniums, and I think the above collection will give better satisfaction than many more costly plants. Start slips in August, give them a sunny window, and keep free from insects by the use of soap suds with a very little carbolic acid added, and I think any one who loves plants will succeed and have plenty of flowers all Winter.

O. F. FULLER.—The plants for Winter blooming that I should recommend are the daisies, carnations, geraniums, petunias, fuchsias, heliotropes, lantanas, smilax and begonias. Those that require a very rich soil or a more liberal use of manure the callas tea roses, and smilax. Plants grow in small pots bloom more freely than those grown in large ones, but are more liable to injure from drying of the earth. Should one be so unfortunate as to have plants slightly frozen, the proper thing to do is to get the frost out as quickly as possible, for many plants will not be injured by freezing for a short time, which would be destroyed if kept in a frozen condition for several hours. To remove the frost most quickly, if the plant be small, dip it into a pail of cold water; or if large, place in the sink and give it a good showering. The best soil for house plants is one containing some undecayed organic matter, like leaf mould or partly decayed sods, with a small mixture of sand. In potting, the soil must be pressed firmly around the roots of the plant, and the pot filled to the top, within one-half inch of the surface; then apply a dressing of some kind. It is well to wash all plants occasionally with soapsuds or whale-oil soap, and particularly the ivy, which needs washing every few weeks to do well; but in all cases the plant should be rinsed in clear water if much soap is used.

THE CHAIRMAN.—In closing I wish to say to the members: Try your hand at crossing flowers. Rub off the anthers of one flower and apply pollen from the anthers of other flowers to the pistils of those from which the anthers have been removed. The results may be beyond your expectations—the interest in these Discussions is increasing I am glad to say. The subject for the next Discussion will be announced next week.

THE YOUNG QUERIST.

Lillie VanB., Stockport, N. Y., asks how to grow pinks in the house this Winter.

ANS.—Pot them the same as any other plants for Winter-blooming.

Josie M., Cross Creek Village, Pa., asks if seedling pinks will be of the same color as the pinks from which the seed was raised.

ANS.—They will vary, sometimes more and sometimes less.

S. A. B. wants to know what is the best root that can be fed to a milch cow—one that will not flavor the milk.

ANS.—The Yellow Globe Mangel is good, or the common sugar beet. Roots are valuable Winter feed for stock in connection with hay, etc.

L. A., Chase City, Va., wishes to know if moss from the woods is beneficial or detrimental to potted plants.

ANS.—Moss is good to keep the ground moist, as it retards evaporation and tends to prevent the surface from baking.

New Members of the Club for Week Ending Dec. 3rd.

THE KING FORTUNE-MAKER

OZONE

A New Process for Preserving all Perishable Articles, Animal and Vegetable, from Fermentation and Putrefaction, Retaining their Odor and Flavor.

"OZONE--Purified air, active state of oxygen."--*Webster.*

This preservative is not a liquid, pickle, or any of the old and exploded processes, but is simply and purely OZONE, as produced and applied by an entirely new process. Ozone is the antiseptic principle of every substance, and possesses the power to preserve animal and vegetable structures from decay.

There is nothing on the face of the earth liable to decay or spoil which Ozone, the new Preservative, will not preserve for all time in a perfectly fresh and palatable condition.

The value of Ozone as a natural preserver has been known to our ablest chemists for years, but, until now, no means of producing it in a practical, inexpensive, and simple manner have been discovered.

Microscopic observations prove that decay is due to septic matter or minute germs, that develop and feed upon animal and vegetable structures. Ozone, applied by the Prentiss method, seizes and destroys these germs at once, and thus preserves. At our offices in Cincinnati can be seen almost every article that can be thought of, preserved by this process, and every visitor is welcome to come in, taste, smell, take away with him, and test in every way the merits of Ozone as a preservative. We will also preserve, free of charge, any article that is brought or sent prepaid to us, and return it to the sender, for him to keep and test.

FRESH MEATS, such as beef, mutton, veal, pork, poultry, game, fish, &c., preserved by this method, can be shipped to Europe, subjected to atmospheric changes, and return to this country in a state of perfect preservation.

EGGS can be treated at a cost of less than one dollar a thousand dozen, and be kept in an ordinary room six months or more, thoroughly preserved; the yolk held in its normal condition, and the eggs as fresh and perfect as on the day they were treated, and will sell as strictly "choice." The advantage in preserving eggs is readily seen; there are seasons when they can be bought for 8 or 10 cents a dozen, and by holding holding them, can be sold for an advance of from one hundred to three hundred per cent. One man, with this method, can preserve 5,000 dozen a day.

FRUITS may be permitted to ripen in their native climate, and can be transported to any part of the world.

The juice expressed from fruits can be held for an indefinite period without fermentation—hence the great value of this process for producing a temperance beverage. Cider can be held perfectly sweet for any length of time.

VEGETABLES can be kept for an indefinite period in their natural condition, retaining their odor and flavor, treated in their original packages, at a small expense. All grains, flour, meal, etc., are held in their normal condition.

BUTTER, after being treated by this process, will not become rancid.

Dead human bodies, treated before decomposition sets in, can be held in a natural condition for weeks, without puncturing the skin or mutilating the body in any way. Hence the great value of Ozone to undertakers.

There is no change in the slightest particular in the appearance of any article thus preserved, and no trace of any foreign or unnatural odor or taste.

The process is so simple that a child can operate it as well and as successfully as a man. There is no expensive apparatus or machinery required.

A room filled with different articles, such as eggs, meat, fish, etc., can be treated at one time, without additional trouble or expense.

☞ In fact there is nothing that Ozone will not preserve. Think of everything you can that is liable to sour, decay or spoil, and then remember that we guarantee that Ozone will preserve it in exactly the condition you want it for any length of time. If you will remember this, it will save asking questions as to whether Ozone will preserve this or that article—it will preserve anything and everything you can think of.

There is not a township in the United States in which a live man cannot make any amount of money, from $1,000 to $10,000 a year, that he pleases. We desire to get a live man interested in each county in the United States, in whose hands we can place this Preservative, and through him secure the business which every county ought to produce.

A FORTUNE Awaits Any Man who Secures Control of OZONE in any Township or County.

A. C. Bowen, Marion, Ohio, has cleared $2,000 in two months. $2 for a test package was his first investment.

Woods Brothers, Lebanon, Warren County, Ohio, made $6,000 on eggs purchased in August and sold November 1st. $2 for a test package was their first investment.

F. K. Raymond, Morristown, Belmont Co., Ohio, is clearing $2,000 a month in handling and selling Ozone. $2 for a test package was his first investment.

D. F. Webber, Charlotte, Eaton Co., Mich., has cleared $1,000 a month since August. $2 for a test package was his first investment.

J. B. Gaylord, 81 La Salle St., Chicago, is preserving eggs, fruit, etc., for the commission men of Chicago, charging 1½c. per dozen for eggs and other articles in proportion. He is preserving 5,000 dozen eggs per day, and on his business is making $3,000 a month clear. $2 for a test package was his first investment.

The Cincinnati Feed Co., 498 West Seventh Street, is making $5,000 a month in handling brewers' malt, preserving and shipping it as feed to all parts of the country. Malt unpreserved sours in 24 hours. Preserved by Ozone it keeps perfectly sweet for months.

These are instances which we have asked the privilege of publishing. There are scores of others. Write to any of the above parties and get the evidence direct.

Now, to prove the absolute truth of everything we have said in this paper, we propose to place in your hands the means of proving for yourselves that we have not claimed half enough. To any person who doubts any of these statements, and who is interested sufficiently to make the trip, we will pay all traveling and hotel expenses for a visit to this city, if we fail to prove any statement that we have made.

HOW TO SECURE A FORTUNE WITH OZONE.

A test package of Ozone, containing a sufficient quantity to preserve one thousand dozen eggs, or other articles in proportion, will be sent to any applicant on receipt of $2. This package will enable the applicant to pursue any line of tests and experiments he desires, and thus satisfy himself as to the extraordinary merits of Ozone as a Preservative. After having thus satisfied himself, and had time to look the field over to termine what he wishes to do in the future—whether to sell the article to others, or to confine it to his own use, or any other line of policy that is best suited to him and to his township or county—we will enter into an arrangement with him that will make a fortune for him and give us good profits. We will give exclusive township or county privileges to the first responsible applicant who orders a test package and desires to control the business in his locality. The man who secures control of Ozone for any special territory, will enjoy a monopoly which will surely enrich him.

Don't let a day pass until you have ordered a Test Package, and if you desire to secure an exclusive privilege we assure you that delay may deprive you of it, for the applications come to us by scores every mail—many by telegraph. "First come first served" is our rule.

If you do not care to send money in advance for the test package we will send it C. O. D., but this will put you to the expense of charges for return of money. Our correspondence is very large; we have all we can do to attend to the shipping of orders and giving attention to our working agents. Therefore, we can not give any attention to letters which do not order Ozone. If you think of any article that you are doubtful about Ozone preserving, remember we *guarantee that it will preserve it, no matter what it is.*

REFERENCES: We desire to call your attention to a class of references which no enterprise or firm based on anything but the soundest business success and highest commercial merit could secure.

We refer, by permission, as to our integrity and to the value of the Prentiss Preservative, to the following gentlemen: Edward C. Boyce, Member Board of Public Works; E. O. Eshelby, City Comptroller; Amor Smith, Jr., Collector Internal Revenue; Wulsin & Worthington; Attorneys; Martin H. Harrell and B. F. Hopkins, County Commissioners; W. S. Cappeller, County Auditor; all of Cincinnati, Hamilton County, Ohio. These gentlemen are each familiar with the merits of our Preservative, and know from actual observation that we have without question

The Most Valuable Article in the World.

The $2 you invest in a test package will surely lead you to secure a township or county, and then your way is absolutely clear to make from $1,000 to $10,000 a year

Horticultural.

THE BROAD BELL FLOWER—PLATYCODON.

THE broad bell flowers are near of kin to the campanulas, as Harebells, Canterbury Bells, and the like, and include some of the finest hardy herbaceous plants in cultivation. They are natives of Siberia and China, and perfectly hardy in our Northern gardens. In open, sunny places, sheltered from strong winds, and in a rich, light and open soil well drained, they attain their greatest perfection. In wet and retentive soils they are apt to perish. According to their situation and treatment they grow from 1½ to three feet in hight; several stems arise from each crown and are terminated, as you will observe in the accompanying illustration, by a number of loosely arranged, large, open blossoms. The flowers are single and double, blue, very pale blue or pure white in color, and are produced from July to September. There are two or three reputed species in our gardens, differing from each other mainly in stature and time of blooming. They go under the names of Platycodon grandiflorum, Chinense and autumnale, but, so far as we can perceive, the first named is the only one entitled to recognition as a species, and the others we believe to be but varieties of it. But all are beautiful and well worth growing. They bear any quantity of seeds and are easily raised from the same, either from sowings in the Fall when the seeds have just ripened, or in Spring. A few will blossom the first year, and all should bear a full crop of flowers the next year. And as they advance in age they grow in strength and size. Choice varieties, as the double white, are usually increased by division of the crowns. The roots are fleshy, long and in tap-root style. Our illustration was drawn from a specimen growing in the Rural Experiment Grounds.

BROAD BELL FLOWER—PLATYCODON.—FIG. 554.

RURALISMS.

IF raspberries and black berries have not yet been pruned, it should be done now, at least to the extent of cutting out all the old wood. It has been a matter of observation with me for many years that farmers (and a good many others) in all parts of the country leave this kind of work to be done in the Spring. There is enough, and more than enough, to be done at that time, without doing work that can be better done in the Fall. The old wood may be cut out at any time during the Fall and Winter, and there is no reason why the whole pruning may not be done at this time. The really proper time, however, to cut out the old wood is immediately after the fruit has been gathered. That, too, is a good time to select the new canes for fruiting the following year; but these things are seldom done.

I AM much pleased with the remarks of W. G. W. (p. 755) on the subject of planting fruit trees on the lawn. He states fairly, and in the best of taste, about all that can be said against the use of fruit trees on the lawn, and at the same time he has views broad enough to see how some kinds at least can be introduced with propriety and without offense to good taste. Now will not others follow the good example set by W. G. W. and give us their views on this subject? When I say W. G. W's good example, I mean that they look at the subject from both sides and all sides, and state the result candidly and fairly, whatever it may be. This, to be sure, is not by any means so easy as to look at a subject from one point of view only, and that the one of fault-finding, which perhaps is one of the easiest things in the world to do, but by no means the most conducive to good. This is a subject which should interest everybody who owns an acre of ground, or even less. By-and-by I will submit for criticism (or information if you please) a list of fruit trees that I have used and found to be good for the purpose (including some of the nuts, such as the Madeira or English Walnut, the Shellbark Hickory, the Spanish or Italian Chestnut, the Hazelnut, or Filbert, etc.) with the positions given them. I think the dwarf Japan Chestnuts (one of Mr. Thomas Hogg's introductions) will find a suitable place here in the future. [This bears fruit very early—does it not?—EDS.]

I THINK I have on a former occasion alluded to the Epiphyllum truncatum and its varieties (often called Crab's Claw or Lobster Claw Cactus) as among the best of winter-blooming plants for the sitting-room. They are easily grown, bloom profusely, and succeed well in the usually hot, dry atmosphere of the living-room. A large plant needs to be elevated or placed upon an inverted pot, or, better still, suspended like a hanging basket. They should be grown in a light, sandy soil and regularly watered when in bloom. A little weak manure or ammonia water occasionally when the buds begin to appear, will strengthen both the plant and the bloom. Cuttings strike readily in sand. E. truncatum, the species, is good, but the variety E. violaceum is much better and one of the best on the list. These two (and perhaps Russelianum) may be had of some of our leading florists, but a collection is very hard to get. Carmineum is a very desirable variety, aside from its beautiful flowers, the whole plant being aglow with the rich color from which it takes its name. These remarks may be useful and interesting to H. and C. J. in the "Young Querist's" column on page 806, as well as to others.

IT may not be out of place to say that many amateurs (and especially beginners) make a great mistake in neglecting to "pot off" their cuttings till the roots have become such a tangled mass that it is impossible to separate them without breaking them and seriously injuring the plants. Almost without an exception, cuttings should be potted as soon as they have become thoroughly callused, and in no case should they be left till the new roots are more than a quarter of an inch long. Potted at this time, growth goes on without any apparent check and the young plant soon becomes vigorous and strong and fitted for the performance of all the functions of plant life, placed under proper conditions. If potting be left too long and the roots of the cutting in consequence become mangled and broken, a serious check is given to future plant growth, and many become so much enfeebled as to be put back for weeks, while others die a lingering death. These hints are intended for those who put in cuttings in the Fall with the expectation of having young flowering plants in Winter, as I suggested some weeks back.

I WOULD like to supplement Mr. Bensell's excellent advice on p. 755 in regard to cutting for pear blight. He says, "Cutting far below the outward appearance of disease is necessary," and it certainly is: and to this I would simply add, keep cutting till you come to thoroughly sound and healthy wood, if you have to cut the tree down; for after the sap has once become vitiated nothing will save the tree; and it therefore becomes necessary to cut on the first appearance of the disease. and before it has had time to spread.

HORTICOLA.

A SUCCESSFUL EXPERIMENT.

S Q. LENT.

FOR some time the Michigan Horticultural Society in its quarterly meetings and in its printed "transactions" has given a good deal of attention to the embellishment of country school grounds. This agitation of the subject has evidently met with very general approbation, for the press has quoted quite largely from these papers and discussions. The Society, however, was not contented simply to talk over the subject and discuss what ought to be, or what might have been; but sought at once through the agency of a committee to interest the State department of education and if possible institute a co-operative movement, by which the educators and the horticulturists should unite in active measures that would result in the immediate accomplishment of practical results. This proved a failure. As now constituted, our department of education goes very little beyond mere statistical work, and is unwilling to take hold of any work not directly contemplated in the law and provided for by appropriations.

In February last at a meeting of the Society the failure was discussed, and a second attempt essayed in a different direction. A committee was chosen to interview seedsmen, and ascertain if a donation of flower seeds could not be secured for school purposes. D. M. Ferry & Co, of Detroit, responded favorably and an arrangement was made by which the first five schools in any county making formal application signed by the school director and teacher, should have returned to them a selection of flower seeds *provided* an agreement should be properly executed by which the State Horticultural Society should secure a report of success with suggestions, made to the secretary in the following October and November.

Prof. W. W. Tracy, whose name I see occasionally connected with valuable articles in the RURAL, took a lively interest in this experiment, and prepared with the greatest care detailed directions to be inclosed with each school collection of seeds; while D. M. Ferry & Co., did more than they agreed by furnishing in each collection 25 varieties of seeds, selected especially with regard to the use intended for them.

About eighty schools applied and received seeds and nearly all have reported progress. Michigan suffered terribly from drought the past Summer, especially in June; in many parts of the State no rain fell for four weeks during the last of May and in June. Each report mentions this difficulty and in some cases the trial proved nearly a failure because of this obstacle in the outset. In all cases the work was done very largely by the pupils, and many reports say the flower seeds cleared the school ground, fenced, plowed, graded it; and in every instance the arrival of the seeds led to a clearing up of the yard and planting of trees, shrubs and perennial plants at the time of sowing the flower seeds. A number of teachers report the use of the flowers in connection with oral botany lessons; others speak warmly of the good accomplished by the flowers in the school as an embellishment to the room, and a means of educating a taste for beautiful things.

One teacher says the experiment at the school yard bore fruit throughout the whole district, as each pupil who had a bed or portion of a border to care for at school employed the experience there gained in securing further results in the home yard. Another school reports the use of the flowers grown, as kindly tokens sent to the sick, and of bouquets in abundance culled for public entertainments.

A large number speak of the attempt as less successful than they might wish, but that seeds have been saved for another year when by means of the experience already gained and perhaps a more propitious season, the work will certainly be more satisfactory. In one case reported, the teacher found no fence about the yard, and could not get the school board to erect one. But the seeds came and they must be protected if sown. The dilemma was placed before the pupils and solved by them, for all took hold, and from a saw-mill about a mile away secured "edgings" enough to make the fence, which, although not very ornamental in itself, was made so before the closing of the season by the aid of pretty climbers furnished in the collection of seeds. Several schools reported the designs of the flower beds; others detailed their efforts at irrigation; still others reported with justifiable pride, how the satire of the school patrons was turned to warm commendation by the argument of success.

It is impossible in this short sketch to give more than a suggestion of results accomplished by this venture of the State Horticultural Society. I have not had my sympathies more effectually appealed to in a long time than in the reading of the reports of these schools which have been made to Secretary Garfield. I am quite aroused to the notion that a grand work could be done by a State department of education, if once entered into with the proper spirit and knowledge. I am certain that better results would be accomplished by work of this kind than in poring over tables of tardiness, accounts of attendance, or bulletins of behavior.

I have gleaned a few points from the reported results of this venture, that may be of use to others.

1. There is no question but pupils, large and small, will unite in the ornamentation of school premises if teachers will only make the attempt and awaken enthusiasm in regard to it.

2. The time thus spent is of real value in the education of pupils upon matters that will have more influence upon their future than the study of algebra, grammar and many other things that are given prominence in the district school.

3. To succeed in the enterprise of adding beauty to school grounds, it is of the highest importance that the matter be brought home to the teachers in such a way as to command their interest. This can be done by giving the subject a leading place in teachers' institutes; and by *examining* and grading the applicants for certificates upon the care and adornment of school-houses and grounds. As the terms of school are most generally arranged, a long vacation occurs in the Summer months, when flowers need special attention. This fact present a difficulty which has two solutions: As increased importance can be given to ornamental trees and especially shrubbery, using such annuals as require the least attention and give the least returns in July and August.

If annuals are employed largely and require care during vacation, arrange by committees of pupils to care for them during the recess in such a way as to stimulate their pride in the undertaking, rewarding them, perhaps pecuniarily by a subscription fund, or by allowing a certain amount of freedom in gathering flowers from the borders.

4. Work of this character successfully carried on at the school premises, is an educational force which acts indirectly but effectively upon the whole neighborhood, creating an atmosphere of good taste of inestimable value in the home life of the residents.

Grand Rapids, Michigan.

The Horseman.

EASTERN MARKETS FOR WESTERN HORSES. No. 3.

L. S. HARDIN

IN the two preceding papers I have outlined the system of horse breeding at the East that has led to an almost entire abandonment of breeding for style and strength. At the same time I have shown that the market for this kind of noble and useful animal is the only truly profitable commercial market for horses at the East. While the Eastern farmer has been wasting his opportunities, the farmer at the West has, with a keener eye to the useful and profitable in horse flesh, been putting his farm in order to supply this growing demand. It is only necessary to stand on the curb-stone of one of the business streets of New York City and mark with a critical eye the heavy draft horses as they pass to learn what lines of breeding have been used in nearly every instance to form the grand physiques of these noble beasts. The short neck, rounded body, heavy legs and shaggy fetlocks, with long, flowing mane, tell the tale of Norman origin beyond a doubt, though the infusion of home-made blood may be so great that the prevailing colors of the pure-breds may have entirely passed away.

Many years ago the horse breeders of several Western States, and of Illinois particularly, determined to try the French Norman horse, and in keeping with this idea many large importations of this blood were made, and these have been quite systematically kept up down to the present time. The effect of these importations has been a very general dissemination of Norman or Percheron blood throughout the Western States, that in a diluted form has accomplished a vast deal of good which might never have been done had the blood remained in a pure state, as there has been considerable prejudice against the pony shape and reputed soft feet of the pure Percherons.

The fact that larger horses are grown at the West than at the East may in a measure be attributed to the generally larger scale on which everything pertaining to the farm is carried on at the West; also to the natural effect of a more bountiful soil where no stint of feed is known. There all animals grow to a greater size than they do upon the inhospitable hills and sand valleys of the North-eastern States. Then again, farmers with large cribs of grain feed far more generously than those with smaller cribs, even when the corn costs just as much labor and risk in the one instance as in the other. The man with an abundance on hand is never so economical in its use as he whose stores are smaller, though the aggregate amounts may be equal. A farmer at the East seems to be frightened when he sees one of his colts taking on a massive form, for he thinks the animal is going to eat him out of house and home, and he consequently takes immediate steps to get rid of him. Then again, none of the Eastern farmer's tools are fitted to the large horse. No collar will fit him. The shafts and wagon poles are too short. The stalls are all too narrow, and even the small bridges on and about the farm are too weak for him. Everything is built on a smaller scale, and the large horse is therefore an awkward animal to have about the farm.

It is to be hoped that the Clydesdale will be more fully introduced and thoroughly tried at the West than it has been. The chief objection to this breed is a want of style. The French Percheron has the advantage that if the size of the colt is not sufficient to make a first-class draft horse, the chances are that there will be sufficient style to make a good carriage or park horse. The Clydesdale, as a rule, is large, massive and wonderfully strong, but he is rarely useful for any other purpose beyond the dray or truck, which is not by far the most profitable use he might be put to. This fault could, of course, be remedied, and often is by judicious selection in choosing a stallion to breed from, though I know not how the long legs could be gotten rid of.

It, however, is by no means certain that either the Percheron or Clydesdale breeds would in the end be the most profitable, if a man should set himself regularly to work to create a regular line of breeding to produce large and stylish draft horses. There are many families of American-bred horses, from which, if properly selected, crossed and coupled, by feeding and training a new and distinct family might be created possessing all the virtues and few of the vices of the present foreign breeds that are now solely depended upon for blood on the sire's side. This fashion of running to Europe for blood, when just as good can be found in this country, is foolish in the extreme outside of the fictitious value that the term "imported" creates. It is to be hoped that this fashion will soon run its course, and breeders will turn their attention more earnestly to home-bred animals. Animal life is so plastic that the skilled hand can mold it at will, and with judicious selection and manipulation a few generations will fix the types desired and prove a permanent source of profit to the originator.

In summing up the question of profit and loss in furnishing Western horses for an Eastern market, the question of transportation cuts an important figure. There is no point about the business that will require more skill in manipulation to save the shipper from gross imposition. In the first place, suitable cars are hard to secure, and here the question of season is of much importance, as a lot of horses may be permanently injured if put in an open car in rough and inclement weather, while a close car may do almost as much damage in hot, dry weather. In coming from Chicago to New York the horses should be taken out of the car at Buffalo or some other intermediate point, as it is impossible for some horses to respond to the demands of nature while on board cars. I have known many fine animals permanently injured by overlooking this precaution.

The subject of freight is a serious one. Upon examination I find the prices range all the way from $30 to $100 per car-load from Chicago to New York. This matter is entirely within the control of the railroad companies, and there is no way to get uniform rates. Each shipper must use all the wits he possesses and not forget to call in the aid of any friend he may have who stands in high favor with the railroad authorities.

In preparing horses for the market, care should be taken to see that they are freshly shod and well groomed, and it is quite the thing in this city at present to have the tail nicely docked. These small points add materially to the profits and expedition of the sales, and should by no means be underrated by the seller.

Farm Topics.

A CATTLE-FEEDING EXPERIMENT.

PROFESSOR G. E. MORROW.

IN the Spring of 1880 eight young steers were purchased for the experimental farm of the Illinois Industrial University. Two were full-blood Ayrshire, two seven-eighths Devon, two one-half Hereford—the dams being "common" cows—one a full-blood and one about three-quarters Shorthorn. They were in ordinary condition, the younger Hereford and the grade Short-horn being in best flesh. They were counted fair specimens of the different breeds, except the older Hereford, which was small for age, and not of especially good form.

It was purposed to compare the different breeds under ordinary treatment, rather than to secure largest development. May 1, 1880, one of each breed—numbers 1, 2, 4 and 6 of table—was placed in pasture with other cattle, until October 1, when they were turned into a corn-stalk field. The other four were kept in a small pasture, which proved quite poor during a part of the Summer, having also corn each day. They were placed with the others in October, and all were wintered in an open yard, with unthrashed oats, much injured from lodging and rains, thrashed Timothy straw, corn-stalks and a very little corn at the last. From May 1 they were all on pasture, Timothy, Blue-Grass and clover, with full feed of shelled corn, averaging about 200 pounds per day for the eight head, until September 1; after this they were fed new corn in the ear, about one-half bushel each per day. From July until cool weather they were on pasture only at night, having shelter during the day in a rather dark shed. There was severe drought both Summers, especially in 1881, the pastures becoming very short. The Winter was a trying one on stock exposed to the storms and mud.

In August one Ayrshire steer met with an accident and had to be killed. November 4 the remaining seven were shipped to the Chicago fat-stock show, where they were slaughtered November 12.

The accompanying table gives the ages, weights at different times, and results of the slaughter test. The home weights are "full weights"; those at slaughter are after being without food or water about eighteen hours. A committee of butchers examined the carcasses and their judgment is given in column "Quality of Carcass."

Number.	Name.	Breed.	Calved.	Weight May 1, 1880.	Weight November 1, 1880.	Weight May 1, 1881.	Weight November 4, 1881.	Weight at slaughter.	Weight of dressed carcass.	Per cent. of carcass to live weight.	Fore-quarters.	Hind-quarters.	Hide.	Tallow.	Quality of carcass.
1	Jo	Ayrshire	March 1, 1879	565	785	965	1335	1290	735	56.98	375	360	75	75	Fair.
2	Jack	Ayrshire	Feb. 3, 1879	565	785	965	1335	1290	735	56.98	375	360	75	75	Fair.
3	Thomas	Devon	March 1, 1879	490	685	820	1195	1150	650	56.52	335	315	75	75	Fair.
4	May Duke	Devon	March 1, 1879	495	685	820	1195	1150	650	56.52	335	315	75	75	Fair.
5	Burnham	Hereford	May 1, 1879	495	710	850	1215	1170	675	57.69	345	330	75	75	Fair.
6	Junior	Hereford	Oct. 1, 1878	565	785	965	1335	1290	735	56.98	375	360	75	75	Fair.
7	Ezra	Short-horn	Aug. 30, 1879	565	785	965	1335	1290	735	56.98	375	360	75	75	Fair.
8	Oscar	Short-horn	April 1, 1879	635	840	1100	1475	1430	815	57.00	415	400	75	75	Fair.

Tables are not interesting reading, but some suggestive facts can be learned from this one. It is noticeable that no one of the steers fed grain the first Summer made as much gain as his mate on better pasture, without grain. It is evident that "rough wintering" was not profitable with these cattle. No one made a good gain, and two lost slightly. The steers were weighed, as a rule, each 60 days during the whole time, and the record shows

that no one of them progressed uniformly. The large shrinkage at slaughter is accounted for by the fact that the home weight was after eating and drinking; the slaughter weight after fasting.

While no one of the steers was excessively fat, the percentage of carcass to live weight is satisfactory. The Short-horns stand first in this respect, one Hereford next. The committee complimented all the carcasses as being more profitable for consumption than those of the excessively fat animals slaughtered with them. The highest percentage of carcass among the latter was 67.56. The showing made by the Ayrshire steer is very creditable for an animal belonging to a distinctively milk breed. It happens that the order of merits of the carcasses is placed in the same order as the proportion of "improved blood" in the different animals. Singularly enough, the carcass pronounced best had, relatively, the lightest hindquarters. This steer was the favorite of almost all who saw the cattle when alive. The steer with largest percentage of tallow was placed last in merit of carcass; the next to him in tallow were placed first and second in merit of carcass. The grade Herefords had heaviest hides in proportion to live weight.

It is expected to continue like experiments. The results of one must not be considered conclusive.

THE FARM DIARY.

UNDER the above head, on page 793, W. F. Brown presents an article that ought to be read by every farmer in the land. It is strange, not to say unwise, that so many persons allow their years to pass by without a semblance of a record to which they might often refer with both pleasure and profit. Our passing life is of too much importance to be left behind forgotten and unrecorded, and it seems to me that every person should keep some other record of his passing life than the feeble and inaccurate one which naturally impresses itself upon the memory.

But I believe there is a slight practical error in the article referred to. Experience has proven to me that to keep an accurate daily record of one's passing years, giving each day an account of the weather and the work done, requires more time and trouble than most farmers are willing to give to the work; besides, such a record kept up for a time, though of much use in the way described by Mr. Brown, becomes somewhat monotonous. I have frequently in former years undertaken to keep a diary upon the general plan of this correspondent; but after a time the work was always given up, not, however, without sorrow; for I was always fully impressed with the importance of keeping some kind of a record of my doings. I think my experience in diary keeping has not been an exception; if it has, my writing here is out of place.

Being unwilling to keep no account of my passing time, I thought upon the plan of keeping a weekly record—a sort of a weekly retrospect, which I immediately put into practice and which I have since continued. I find little difficulty in recalling, once a week, the incidents worthy of record, including the character of the weather and kind of work I have been doing, and the exercise of such recalling has strengthened my memory and thus benefited me.

Such a record or retrospect kept through a term of years, and containing, besides the valuable practical information which every farm record should contain, many little incidents and reminiscences of one's passing years, cannot be re-read without interest. My own plan of writing is to make each weekly record a little essay in itself, giving therein the tone of my thoughts, and the principal kind of work performed during the week. Any happenings of personal interest or of general importance are recorded, and it is sometimes my lot to note the death of a dear friend or relative.

It is good for a person to stop the wheel of business once a week and review the work and note the happenings of the time. Once in a year it has been my custom to review the year's record, and make a yearly retrospect, embracing the important incidents of the year past, together with a record of the results of the farm, and the general character of the season, whether favorable or otherwise. The prices of the important farm products are recorded frequently during the year and all experiments with their results are carefully noted.

Such a record, I believe, is a means of great improvement to all young men. The work, if carefully performed, teaches one by the practice it gives in the art of penmanship and composition.

How can we estimate the value of such a record carefully kept and preserved through the working period of one's life? What pleasure and interest could be taken in retracing the pages and noting the incidents of years long past, and the record of one's life's doings? Aside from the pleasure and comfort which might be derived from such a record, a great deal of practical information could be gathered from the pages. One's future is shaped largely by past experiences and if the experiences have been recorded they are much less likely to be forgotten.

I have usually chosen as a time for writing my little weekly retrospects, the quiet and leisure of Sunday afternoon or evening. Those who may think this an inappropriate pastime for the Sabbath could substitute another time, and devote the day of rest to more satisfactory occupation.

It is well for us to look back occasionally and review the experiences and incidents of past years, to see wherein we have erred in judgment or missed golden opportunities. A record of the past is a partial guide for the future.

G. A. G. JR.

EARLY HISTORY OF AGRICULTURE.

LESTER A. ROBERTS.

AGRICULTURE may be defined as the working of the ground in such manner as to fit it for the production of articles necessary or desirable for the food of man.

The earliest want of man or animal is food. In the primeval ages of human existence, before the dawn of intellect, the race doubtless existed on the spontaneous products of the country in which they lived. Fruits, herbs, berries and roots each contributed their share. As the race improved, the brain increased in size, and thought, reason, contrivance and invention gradually assumed their places. Eating, besides being merely a life-sustaining operation, came to be a pleasure. What was before a need grew to be a want—a desire, to gratify which Man gave his time and labor, and before the period to which even traditional history extends, we may reasonably suppose there were many Cains who were husbandmen and Abels who were shepherds.

Although it is doubtless true that the historical traditions of Eastern Asia extend much further into the days of antiquity than do ours, we learn but little from them relative to the pursuits and occupations of the people. We may reasonably infer, however, that the early history of one nation is in most respects the same as that of another. Probably Moses, who wrote more than 3,600 years ago, is the earliest authority in agricultural literature. From him we learn that more were engaged in pastoral pursuits than in tillage. But in one or the other all took part. Industry, or perhaps occupation would be the better word, seems to have been expected of all. Noah planted a vineyard, Abraham had great numbers of cattle, while his brother Lot had flocks and herds. Gideon is mentioned as having been found thrashing, and Saul, a king, as driving the cattle home from pasture. David fed his ewes, and Elisha plowed with 12 pairs of cattle. Moses himself was a shepherd.

The land of Canaan was better adapted to grazing than to tillage, while the fertile lands of Egypt gave back to the planter better rewards for his labor. It is supposed that wheat was first raised in the valley of the Nile, and we may readily believe the invention of agricultural implements was the work of the Egyptians, the first of which, the plow, seems to have been evolved from something like a pick—the earliest instrument used in tillage. Representations of the primitive plows are found on some ancient sculptures.

There is no doubt that the Egyptians carried agriculture nearer perfection than any others of the ancients. True, the country bordering on the Nile four or five miles in width and as many hundreds in length, needed no culture. To scatter seed at the time of the overflow and reap the harvest when the waters subsided, were in some cases all that was required. But the immense works constructed for irrigating large tracts of country at a distance, remains of which still exist, are proofs of the enterprise and energy of these early farmers. Hundreds of canals of great length served to carry the flood waters of the Nile to immense reservoirs in the midst of unwatered plains, which were thereby made fertile and productive. Hydraulic works of ingenuity and power were constructed by means of which the water was carried to the very hill tops to be distributed at will among the fields and gardens below.

But the race that once inhabited Egypt has gone. Barbarians overran the country. Great winds from the desert bore on their wings clouds of sand which covered thousands of square miles that were once cultivated fields, and the Genius of Agriculture took her way to other lands.

More than a thousand years before the Christian Era the Greeks had made considerable progress in agriculture. It had doubtless been introduced to them, as were many of the arts and sciences, by immigrants from Egypt. Not naturally well adapted for agricultural purposes, the working of the soil presented many obstacles to be overcome, but persistent effort won the victory, and the most uninviting places were converted into productive fields.

The fullest account of Grecian agriculture is probably to be found in the writings of Hesiod. A poem entitled "Works and Days" contains not only a treatise on agriculture, but is intended to cover the whole domestic economy as well. We learn much also of the condition of agriculture in Greece in their times from the writings of Xenophon, Herodotus, Theophrastus and others. Of these named those of Theophrastus were the most extensive, embracing a work on natural history wonderful considering the time in which it was written, and instructive on many points to students of the present time.

The Greeks understood and practiced the application of manure, the use of which Pliny ascribes to a king named Augeas. Theophrastus gives a list of six different manures, and adds that a mixture of soils will produce the same effect as the application of manure thereto, as, for instance, the application of sand to clay soils, or of clay to sandy ones. It is true that the strongest love of the Greek was for art rather than agriculture; for building up cities rather than improving fields. But, nevertheless, great improvement was made in agriculture. We know they had fine breeds of cattle and horses, and raised most of the grains and legumes at present in cultivation as well as the vine, fig, olive, apple, date and other fruits at the time when Greece became a Roman colony—about B. C. 100. During all these years other nations were, we know, making some progress in agriculture, but history gives us little that is definite concerning them.

The Jews took with them from Egypt many ideas that were valuable, and followed them so far as they were applicable in a country so different. Babylon had a rich soil that was cultivated to a considerable extent. Cyrus, King of Persia, is recorded as having distributed with his own hands prizes for excellence in agricultural results. The Phœnicians gave more attention to manufactures than to tillage. The Carthagenians were among the earliest agriculturists, and their example spread into Spain, France and Southern Italy. But as Egypt may be said to be the cradle of the Sciences and Greece of the Arts, so is Rome of Agriculture.

Among the early Romans farming was fashionable. The lands were occupied and cultivated by their proprietors. This was undoubtedly one reason of success, but another doubtless was that the amount of land each one could occupy was limited to a few acres. Commerce was thought degrading. War and agriculture were the chief pursuits, and when the warrior returned to his farm he brought with him some of the habits of the camp. Pliny says "they plowed their fields with the same diligence as they pitched their camps, and sowed their corn with much the same care as they formed their armies in battle."

Small farms well worked will ensure success in any age.

But this state of things did not always continue. When the victorious armies of the Romans made extensive conquests and became possessed of large territories, the rich among them purchased large estates, the cultivation of which was entrusted to farmers, but still under the direct supervision of the proprietor. Cato gives us an illustration of what is the duty of a landlord on visiting his villa from his city residence, in which he supposes him to be not only perfectly acquainted with all the work necessary to be done on a farm, but the time and manner in which it should be done.

Varro complains that in his time, B. C. 50, the strict supervision of former times was wanting, and that the proprietors employed themselves too much with the circus and theater, and too little with corn-fields and vineyards.

Columella, who wrote in the first century of the Christian era, complains that in his time agriculture was almost entirely neglected. He says that while there are professors of almost everything else, even of gluttony, there are no professors of Husbandry. But it seems from the minute and valuable directions he gave he believed there were some left who would profit by instruction.

Of the many voluminous writers on agricultural subjects in early Roman times, the productions of none have come down to us save some of the works of Cato, Varro, Virgil, Columella, Pliny and Palladius. But these are sufficient to instruct us relative to the general management of lands, and of the progress of invention and discovery in agricultural implements and appliances. An abridgement or compilation of the works of all these writers was made by a Scotch clergyman named Adam Dickson, and published in 1788 under the title of "The Husbandry of the Ancients."

Whatever improvement, if any, was made in agricultural processes by the Romans, it was probably in the early years of the Empire, and it is doubtful if in its best days it was much further advanced than with the Jews, the Babylonians, Egyptians and other ancient nations. The conquests of the Romans, however, opened new fields and introduced to new peoples agricultural processes that were readily received and greatly improved upon.—To be continued.

Farm Economy.

ACCOUNTS WITH FARM CROPS.

WALDO F. BROWN.

THE keeping of a farm diary will be a good preparation for beginning a system of farm book-keeping, for the greatest difficulty in the way of keeping accounts with crops is the want of a regular habit of writing, and this the farmer who keeps a diary will soon acquire. I have for five years past kept an itemized account with each field on which I have grown wheat, and have found the matter so easy and requiring so little labor, that I propose extending it to all the crops grown on the farm. A very few moments' time, and less than a page of space in an ordinary account book, will keep the account for a year with any field. I think it better to keep the account with each field than with the crop, because there will be items to charge to the field occasionally, which ought not to be deducted from the crop of that particular year. For example, if you grow a crop of wheat, you ought always to sow clover with it, but it would not be just to add the cost of seed and sowing to the expense of the wheat crop which it does not benefit, but it should be added to the cost of the succeeding crop of wheat or corn grown on the clover stubble. If not put down at the time it is sown, however, it is likely to be forgotten, and so I charge it to the field at the time, and then in striking a balance to see what the wheat costs, I omit this item and add it when I strike a balance on the crop grown on the clover stubble.

The first thing to be done when you determine to begin keeping farm accounts, is to put a value on each field, for it would not be equitable to value all the fields alike. If a farm of 100 acres costs $6,000—which would be $60 per acre—I should expect some fields on it to be valued at but little more than half this. The buildings, orchard and garden I would call number one, and on many farms the value of four or five acres here would be $2,000. Then 50 acres of the best plow land might be valued at $50 per acre, $2,500, and the remaining 45 acres at $33.33⅓ would make the $6,000. This estimate would, of course, vary with different farms; but the intelligent farmer would have no trouble in putting a fair value on each field. At the head of each page on which an account with a field is kept, enter the name or number of the field with the number of acres and its valuation. I have adopted the rule of charging each field with eight per cent. interest on its valuation, this including taxes, and I charge all labor at one dollar per day for each man and horse, and let this include board of hands and keep of horses. In harvesting I charge by the acre for cutting the grain the same as it would cost to hire a reaper with hand and team, and in drilling the wheat the same plan is followed. I think this simplifies the keep of accounts, as it saves separate items for board, wear of machinery, etc. I practice a three-year rotation—wheat, clover and corn—and the account begins with a wheat crop. With a field running through these three years I would begin after the corn was cut up in the Fall, for I never sow wheat in standing corn. I use the disc harrow to prepare this corn land for wheat, as the use of it makes just the seed-bed I want, and is a cheap way of preparing the seed-bed. I will now give the account with a ten-acre field running through this rotation.

1878. Account with field No. 5, ten acres, valued at $500. Crop wheat.

To interest on capital		$40.00
" twice harrowing with disc harrow		8.00
" rolling or smoothing with plank drag		3.00
" 40 loads of stable manure		20.00
" 1,000 ℔s bone meal at $36 ℙ ton		18.00
" 10 bush. seed wheat at $1.25		12.50
" drilling at 50 cents ℙ acre		5.00
" 14½ bushel clover seed		9.00
" sowing clover seed		1.00
" harvesting, total expense		20.00
" cost of wheat in shock		$136.50
By 250 bush. wheat at $1.10	$275.00	
Deduct cost	136.50	
Net profit		$138.50

Cost of wheat ℙ bushel, 56 1-5 cents

This wheat cost per acre $13.85, and if, through poor preparation of the soil and withholding the $38 of fertilizers which are charged, the crop had been reduced to twelve bushels an acre, the cost of the wheat would have been more than doubled, and this is what is done by a majority of farmers who sow wheat in corn; if the yield of this wheat should reach 35 bushels per acre the cost would be less than 40 cents a bushel. The reader

will notice that I have made no allowance for hauling and thrashing, for I think the straw worth enough to balance this. The account with this field the next year, if pastured, would show no charge but the $40 interest on capital, unless it might be for repairs on fences. It should be credited with the usual price per month for pasturing stock. If it was cut twice—once for hay, and once for seed—the cost should be charged, and the field credited with the hay and seed. Suppose our account to stand as follows:

Interest on capital		$40.00
Cutting, curing and hauling clover		20.00
Cutting clover seed at 60c. ₱ acre		6.00
Hauling to machine		6.00
Thrashing 20 bush. seed at 75c. ₱ bush		15.00
Hands and board		5.00
Total expense		$92.00
By 12 tons of hay at $7 ₱ ton	$ 84.00	
" 20 bush. seed at $5.25 ₱ bush	105.00	
Total	$189.00	
Deduct expense	92.00	
Net profit		$97.00

The next year of our rotation brings this field into corn and the account stands.

Interest on capital		$40.00
Breaking, at $1.50 ₱ acre		15.00
Harrowing and rolling		10.00
Marking out and planting		7.50
Seed		1.00
Plowing 4 times at 50c. ₱ acre each time		20.00
Cutting up at $1.25 ₱ acre		12.50
Husking, $1.50 ₱ acre		15.00
Total		$121.00
By 450 bushels of corn at 35 cents	$157.90	
" 10 tons corn fodder at $4 ₱ ton	40.00	
Total	$197.50	
Deduct expense	121.00	
Profit on field		$76.50

In the back part of the book I set apart a page for each field, where I simply put down results, as I want this page to show the profit or loss for a number of years. The entry on that page for these three crops would be as follows:

Field No. 5, 10 acres, value $500.

1878. Crop wheat sold at $1.10 in Aug.	Profit	$138.50
1879. Crop clover cut for hay and seed.	"	97.00
1880. Crop corn, yield 45 bushels ₱ acre.	"	76.50

Each of these entries should give the page on which the itemized account is kept so that it could be referred to. I have written enough to show that keeping accounts with the fields is an easy matter requiring but little time or space and I hope if any of my readers can suggest a better plan they will do so.

Field Crops.

EXPERIMENTS WITH POTATOES AND OATS IN KANSAS.

THE seeds sent all grew. I regard the potatoes and oats as having great value. Having tried experiments with small amounts of seed before and generally not having had good success, I procured a bushel of the White Elephant Potatoes and two bushels of Washington Oats. This was a poor year in one sense, and also a good one in another, to try experiments. It showed the ability to withstand drought, but productiveness could not be properly judged.

The potatoes had large vines and grew vigorously until the drought got to the severest point, when they perished. I planted them the second week in May, which was a mistake; they should not be planted here until the last of May or the first of June. The yield was 10 bushels; none were as large as the seed. They were badly rotted at the stem ends caused by drought. I may be mistaken, but I think they are not very valuable. They are too rough and deficient in quality—at least mine were. I had 16 acres of potatoes and experimented with most of the new varieties. I think you are wrong about the Burbank and Saint Patrick being identical. I planted the Burbank last year and this year I planted the two varieties side by side; no difference could be observed in the growth of the vines or time of ripening, but the Saint Patricks yielded better, grew larger, are somewhat closer in the hill, smoother and of a little better quality. [The RURAL has never tested the Saint Patrick.—EDS.] The Beauty of Hebron yielded best—150 bushels per acre, tubers large, but many rotted at the stem ends. The Early Rose, Early Vermont and Alpha had the same fault. The Orange Co. White is a great yielder and is of good quality, but it is the hardest potato to dig I ever had; it refuses to grow in hills like others. The Early Ohio is a great yielder and second to the Alpha in ripening; quality good; grows close in the hill, but was scarcely salable here this year or last; its fault is it has hard, black spots in it; these spots are not next to the skin but often all through, so as to make it worthless. On being cooked and mashed the spots drop out. Would like to know the cause of this. [The Early Ohio is not thus affected at the Rural Farm.—EDS.] The Mammoth Pearl is a great yielder and so far has not been subject to any disease; the vines do not grow so vigorously as is claimed by some seedsmen, and it is of second quality. Dunmore resembles the Pearl, is of the same quality, fully as productive; but not quite so large. Queen of the Valley has the largest and thriftiest vines of any tried; tubers very large; quality good; but it is not a heavy yielder; there are apt to be one or two very large potatoes to the hill. American Magnum Bonum was not as large this year as represented; the yield was poor; the tubers were rough and only of second quality. Watson's Seedling had the same fault as the White Elephant, but was of better quality. It resembles the White Elephant in growth of both vines and tubers and is about a week later than the Early Rose. The Genesee Co. King resembles the Peachblow, but is earlier, more productive and of as good a quality. Perfection I regard as one of the best grown—good first, last and all the time; a vigorous grower, productive and three weeks later than the Early Rose. North River Beauty is not worth cultivation. Victor is a seedling of the Peachblow; color blue, which hurts its sale; of third quality here. A grower can't fool a consumer the second time on it.

The two bushels of Washington Oats produced 65 bushels which weighed 43 pounds per bushel. It smutted badly, but stood up well, and was remarkable for its dark green color while growing. Four bushels of Mold's Ennobled Oats produced 162 bushels; weight, 33 pounds per bushel. This is a black side oat and ripened a week later than the Washington or any other sown. It rusted a little and went down in a few spots; straw a foot longer than that of any other variety. The White Belgian produced from two bushels of seed 35 bushels; weight, 45 pounds per bushel. Stood up well: no smut or rust. Of the White Canadian two bushels produced 40; weight, 42 pounds per bushel; some smut and rust; lodged in places. Of Red Rust-Proof two bushels were sown; yield, 52 bushels; weight 32 pounds per bushel; the grain has a heavy husk and a long beard at the end; stools out more than any other variety sown, but the straw is entirely too short. The oats were raised on a field which had been sown with wheat in the Fall of 1880, but the wheat was winter-killed.

Long live the RURAL for it doeth a good work. I. O. MILLER.

Johnson Co., Kansas.

TOBACCO-GROWING NOTES.

PARTIES building or repairing tobacco-curing barns should by all means provide top and bottom ventilation, which is probably best secured by means of a continuous ventilator extending lengthwise of the roof, and doors at least one foot wide hinged beneath the sills. The roof ventilator should extend the greater length of the building and should be provided on either side with horizontal doors, which should be carefully fitted and arranged to be opened or closed from below by means of ropes and pulleys.

DURING the leisure of Winter tobacco growers should, as far as possible, prepare for next year's plant growing. Sash for covering the plant-beds, which is considered a necessity for the production of early plants in most of the seed-leaf producing sections, should be made or repaired, and everything be made ready, as far as practicable, for the sowing of the seed, so that no valuable time may be unnecessarily spent when Spring opens.

GLASS is the only reliable material for covering the "cold-frames," although canvas, while not a substitute for glass, is preferable to no covering when the seeds and plants are starting. The sash should be made of convenient size for handling: three 8x10-inch lights wide and seven lights in length being about right. The plant-beds should have windbreaks on the north side; a strong, high, tight board fence answers for a good protection.

IN preparing frames and sash for plant-beds growers should bear in mind that an abundance of plant-bed room is a point of great importance in tobacco growing. I have found it an excellent plan to endeavor to raise twice as many plants as will be needed for my own setting. With this management a grower obtains strong, early plants for his own use, which allows him to have his own tobacco early and even, and if when the work of planting is finished there is a surplus of plants, they can usually be sold for enough to cover a large part of the cost of raising the whole. G. A. G., JR.

The Vineyard.

Iona Grafted on Isabella.

I have a grape and peach farm on the banks of Keuka Lake, and during the past season I have had a little experiment which may interest some of the RURAL'S army of readers. The man living on my place is an expert grafter of fruit trees, and in the Spring I requested him to set some cuttings from Iona grape-vines in some old Isabella stocks as an experiment. He did so, and the result was to me quite surprising. They all lived and flourished, making from six to ten feet of strong, ripe wood, and on nearly all of them there were bunches of ripe fruit. From one cane my boy picked and weighed two pounds of ripe Iona grapes. N. W.

Dairy Husbandry.

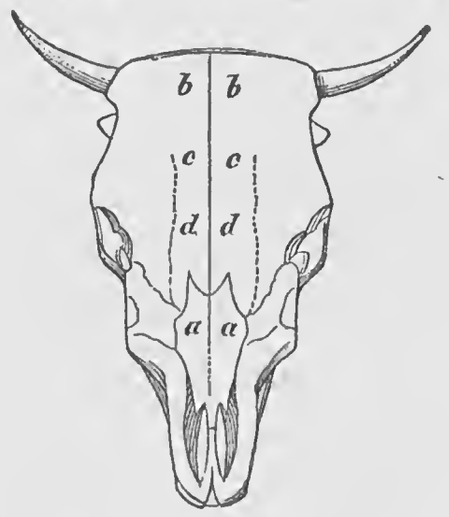
THE DAIRY COW.

HENRY STEWART.

Catarrh (Hollow-Horn.

MANY writers and other persons have "made merry" and have used sarcastic remarks in regard to the popular belief in "hollow-horn." A man needs to live and keep his wits about him and observe and study for half a century sometimes, before he comes to learn that nearly all popular beliefs have some basis of truth for their foundation. And so "hollow-horn" or "horn-ail" is really and truly a matter of fact. The only mistake about it is that the popular name indicates the effect of the disease and not its original source. This is, in fact, catarrh of the living mucous membranes of the nasal and frontal sinuses of the head. This disease is so frequent and so often serious that it is worthy of particular notice for its own sake, and more especially to help to remove the popular ignorance about it by which the troubles arising from it are left without remedy because they are ignored. A description of the head of an ox or cow may be useful for this purpose.

At Fig. 555 is an outline of the skull of a cow upon which the letters *a*, *b*, *c*, *d*, show the positions of the sinuses or interior cavities of the skull, which serve to greatly strengthen the frontal bones and enable the skull to resist the concussions which are common with horned animals. The line down the center is the median suture of the frontal bones. At *a*, *a*, are the bony plates which cover the nasal sinuses; at *b*, *b*, *c*, *c*, and *d*, *d*, are the localities of the divisions of the frontal sinuses. In the ox the frontal bone, which in fact forms the foundation of the face, is largely developed, and is of great thickness.



SKULL OF A COW.—FIG. 555.

From this bone proceeds at each side of the upper extremity the bony cores which support the horns, which, however are not the horns but important portions of the skull. These horn cores are filled with small vascular channels and canals, to such an extent as to render their substance extremely spongy in appearance. The frontal sinuses are prolonged into these horn cores. The horns themselves are attached to the skin only, and are merely the protecting covers of the cores which are extremely sensitive and extensively supplied with veins, arteries and nerves. The horn itself is wholly insensible, as is the hair, being, in fact, in structure nothing more nor less than hair compressed into a solid form, so to speak.

This explanation of the structure of the horn and its immediate connection with the interior of the skull, should be sufficient to show how easy it is for the horn cores to be affected by any disease which involves the membranes lining the cavities of the skull. Exposure to cold or to sudden changes of the weather almost invariably produces inflammation or catarrh of these membranes; and, of course, the horn cores are affected at the same time because the membranes reach into and entirely through their substance, which being extremely cellular on account of the numerous canals and passages, is covered by a very large surface of the sensitive membranes.

Inflammation soon leads to suppuration, and the passages which lead from one sinus to another may soon be partly or wholly closed by the swollen condition of the membranes and the accumulation of the secreted mucus with whatever pus may have formed. Here then are sufficient causes for the extreme uneasiness and distress which mark this disease and produce the weakness and emaciation common to it. The appetite is lost; the whole system is feverish and disturbed; the circulation is disorganized; the patient suffers the most violent pains in the head from the compression of the mucus and the pus in the cavities as well as from the congestion of the blood vessels. The owner, under the advice of some neighbor, bores into the horns with a gimlet and the pus is discharged, giving instant but temporary relief. Perhaps under the continuous effect of the disease the bony cores have entirely sloughed away and have passed through the nostrils in the shape of a fetid, purulent discharge, and when the horns are bored they are found completely hollow. We may thus see how the popular idea of hollow-horn has originated, and that it is justified to a great extent by the facts.

The treatment of this disease is somewhat difficult from its deep-seated locality. Prevention, by careful attention to the warm, dry, comfortable lodging of the stock, will avoid it. When it occurs, and the inflammation has spread to the horns, the case may be treated by blisters or other counter-irritants upon the poll, and even by boring the horns and injecting soothing and antiseptic liquids, which may wash out the affected cavities and restore the condition of the membranes. Warm water with 10 or 12 drops of carbolic acid to the pint would be employed beneficially. But medicines should also be used. A strong cooling purgative, for instance, one pound of Epsom salts, with an ounce of nitrate of potash (saltpeter) added might be given and repeated the third day. After that, a daily dose of one ounce of hyposulphite of soda should be given until recovery is assured. Warm mashes and gruels would be very beneficial; warm clothing; steaming the nostrils, and washing them with the carbolated warm water would also tend greatly towards a recovery. By neglect, the disease may become chronic, when the distress suffered would greatly lessen the value and profit of the animal, and it is very probable that the disease would prove infectious or contagious in a herd, and is therefore all the more serious on that account.

The Herdsman.

NOTES BY A STOCKMAN.

SOMEBODY, I think a correspondent of the RURAL, stated recently that in regard to sheep, in England mutton was considered first and wool last. This is not correct, although mutton is there an important consideration in the business of keeping sheep. An English writer on this subject recently said: "The high price of wool changed my views." . . "An Oxford Down should have the poll well covered with wool, adorned with a top-knot on the forehead, a good fleece of wool, not too curly, a well-formed barrel on short, dark legs, with good firm mutton." Now, if we take this writer, who is a prominent sheep breeder, as an example, wool is first and mutton last; and this is the case every time. Sheep are classed in England by their wool and not their mutton, and as long-wools, medium-wools and short-wools; and the mutton is entirely a secondary consideration.

A LARGE sale of Short-horns from the Bow Park herd (Canada) was held on the 10th ult. at Waukegan, Ill. Some high prices were obtained. Grand Duchess of Oxford 29th brought $4,025; Duchess of Horton, $2,030; Waterloo 38th, $1,700; Kirklevington Duchess 17th, $1,270. Six bulls and bull calves averaged $584 each and 32 cows and heifers averaged $583.

THE annual meeting of the American Clydesdale Association was held at Chicago the 10th of the last month. A scale of points was submitted and some preliminary measures taken to establish a stud book. This is a necessary precaution, considering the increasing favor with which these horses are received here and the fact that in Scotland and England a stud book is kept for the record of pure-bred animals. [The above notes have been left over for some time.—EDS.]

AN extraordinary comparison of the increase in our export trade of live stock and its products during a dozen years past is given in the following figures.

	1868.	1881.	Increase.
Export of live stock	$733,395	$16,412,398	$15,670,003
" cattle products	14,833,291	70,169,611	55,336,320
" hog products	18,502,660	105,791,231	89,291,591

TOO much mutton is said to have been the cause of the death of 17 shearers during the shearing of a flock of nearly 100,000 sheep in New Mexico, the men not having been used to eating this kind of meat. Perhaps this mutton may have been of the "lantern" kind and not easily digestible even to a New Mexican ranchero, who can sometimes digest a piece of broiled rawhide.

THE State Veterinarian of Illinois has had a hard time of it recently in attending to calls from different parts of the State to investigate cases of supposed pleuro-pneumonia. He has found nearly every case to have been Texan fever, and the others to have been due to inflammation caused by the presence of parasitic worms, Strongylus filaria, in the lungs and air passages. As this parasitic disease is very frequent in calves there is little

doubt the same kind of pleuro-pneumonia affected the young calves from the East which have created such a rumpus in Illinois; that is, if any at all were really found sick, of which no sufficient evidence has yet been given.

In the "Great West," where everything is so lavishly supplied by nature, one is apt to scorn ideas of economy. It does not pay to stand there over trifles; one has not time to stoop to pick up a corn ear, for while he is stooping a whole shock of corn may be gathered in the arms and cast into the crib. This is the popular Western faith. But the Great West, that was, a few years ago, the "Great West," has come down to ideas of economy and feeds corn in troughs and fodder in racks, and no longer turns the steers into the fields to do the harvesting and husking for themselves; while the present "Great West" is going through the old experience.

Every one sympathizes with this lavish style of management. It is like the great, generous heart of the West, where the latch string is always on the outside, and the unbidden but always welcome stranger is never questioned as to whence he comes or whither he is going. But it is not business; and E. W. S., in his article on "Winter Stock Feeding," touches the very point when he writes (page 796) of the waste of out-door feeding and the cheapness of comfortable shelter. But stables are not required, nor need the wild, untamed Western steer be reduced to the ignoble necessity of going under shelter of a roof.

Some years ago, during the life of the late Mr. George Grant, I suggested to him to put up for the protection of his large herds and flocks in Western Kansas, some cheap and easily made, open shelters after the manner of the Scotch mountain graziers, in which the rough, hardy Highland cattle take comfort in the worst of those fearful storms which sweep over their exposed pastures. These "stells," as they are called, are mere circular or curved walls of rocks and turf, or even heather or brush interlaced among stakes driven into the ground, with the hollow side turned from the direction of the storms. Protection for a thousand head of cattle may easily be put up at a cost of 25 cents a head, or even less where the materials are so plentiful as on the great prairies; for nothing is better than sods turned up by a breaking plow. Even a quantity of cornstalks packed in between a double row of stakes would serve the purpose exceedingly well.

A story with a moral comes anent a bull taken out to water after dark by the light of a lantern. The bull attacked its attendant, broke the lantern and set fire to the barn which was consumed. There are, indeed, several morals attached to this sad story. No bull should ever be let loose when a lantern is about. The glare makes the quietest animal furious, and he will rush upon it, not seeing the person who is holding the light. No person should be watering his stock by lamp-light. That argues carelessness, neglect and irregularity, and when one commits these sins, his sin always finds him out.

Regularity in feeding and watering stock of all kinds is indispensable to economy and success. Animals worry when the time passes at which they should have been attended to. "At what hours do you feed?" I once asked a farmer who had a fine flock of fat sheep nearly ready for the market. "Five in the morning, ten, three in the afternoon and eight in the evening; and I have not missed a meal at these hours one day this Winter," he replied. And his fine sheep showed that his attention had been well rewarded.

Cross-breeds and grades are the butchers' animals—necessarily so in one sense because pure breeding animals are too valuable for beef. But yet when one never sees or hears of a pure-bred steer, ox or heifer being fattened for beef, it tends to show that breeders are not careful enough in the selection of their breeding animals. There are always some beasts, even among the pure-bred animals, that would do better service on the block than in the pens, and breeders ought to show what is the intrinsic value of their stock by exhibiting a fatted steer or heifer now and then. A leading Western paper, reporting on the Chicago Fat Stock Show, remarked that Short-horn breeders had not made any advance in the quality of their stock since 1817, for the best Short-horns at the show traced back to the "seventeens." The statement is scarcely worthy of consideration, although some of the descendants of the "seventeens" may be hard to beat. But breeders of modern strains should prevent these criticisms by showing what they have to offer, and the excuse that their stock is too valuable is not justified for the reason above stated.

Among sheep at Chicago it should be noted that some of the prize animals were Cotswold and Oxford Down, Cotswold and Shropshire, and Cotswold-Merino crosses. The last kind, which was recently illustrated and described in the Rural, is one of our best crosses, if not *the* best, for lambs and mutton, and wool also. It is one of the most convenient, too, and should become a popular sheep.

What is the cost of a colt? Mr. Hardin's figures are excessive. Let us put the service at $50, for which a first-rate horse can be engaged. The first year, the colt can be well kept for about $15 or $20, all expenses told. The second year the cost of a Summer's run in a pasture will hardly be worth estimating, and the Winter's feed may cost $30. The next year the colt will earn its feed, and the fourth year will do better, and in fact pay by its work for the first and second years' feeding. If the owner gets then $150 or $200 for the colt he has done much better than any dairyman can do with a cow, although it may be a high-bred Jersey with a long pedigree.

The most profitable horses that are raised are those used in the cities and towns for light hauling and for street cars, and in the country for general work and for the road. These will sell readily when four years old for $150 to $250 or $300. A large number of them are raised in Ohio and Western Pennsylvania, Indiana, Michigan and Canada, and I aver that they make more money for the farmers who breed them than any cow in the world would do. And they have paid for every dollar of their cost by their work before the dealer picks them up. These are the progeny, too, of cross-bred stallions, for whose service only $10 or $20 are paid, the former price being most usual.

Pure blood is very good and excellent, in fact, and its use is to be encouraged. But the stream is too small to be tapped at every farm, and although I may be committing a grand heresy in saying it, I declare that *the farmer* cannot afford to have much to do with it on account of its cost. A few may who have means to turn the expenditure to good account.

There are exceptions—with sheep, for instance, and with pigs—because this class of stock comes to profit so quickly. A pure-bred Hampshire Down ram, in a flock of 50 ewes, will return a cost of $50 in a year, and for several years after that will return the same amount from the lambs only. The same with a pure Merino ram on a flock of light "lantern-skinned" Western ewes; and the same with a Berkshire or Poland-China boar.

So, too, it has paid handsomely to improve the Texan, Cherokee and Colorado cattle by the use of Short-horn and Hereford bulls; but it should be observed that it is not the fancy stock, high-priced bulls, that are used in these herds. Some drops, or "dashes," of the best blood may flow in the bulls used, but it is the working, every-day herds that supply the stock which does the improvement.

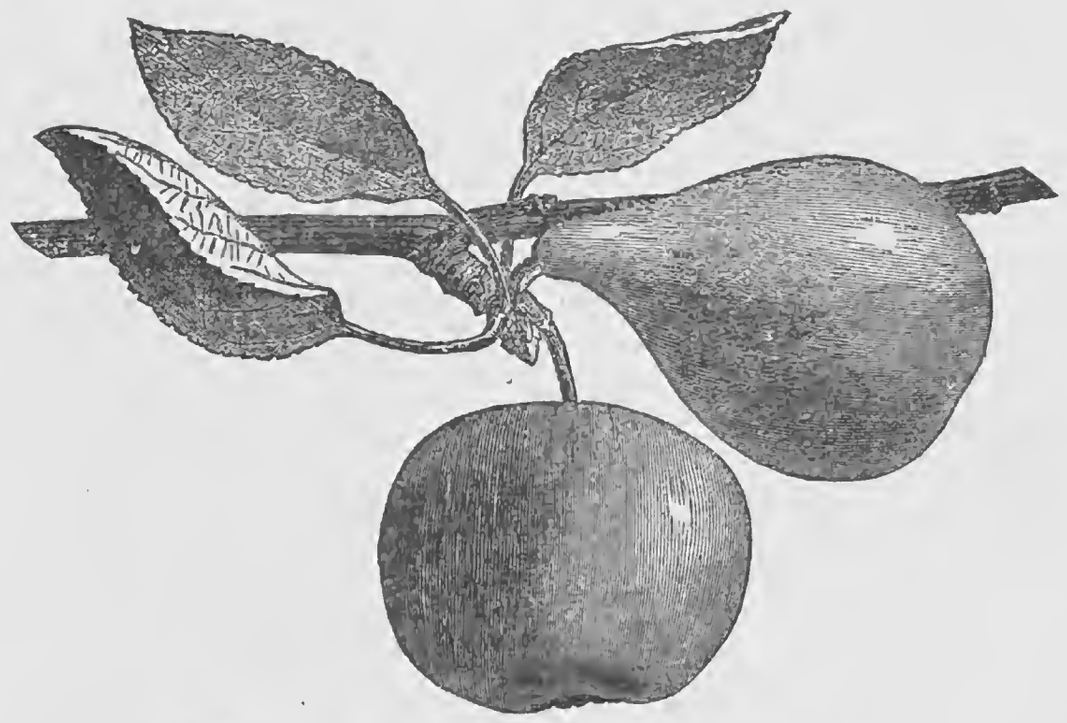
We can hardly say that we have got down to that point yet in some other branches of breeding stock for profit.

Pomological

TWO FORMS OF APPLE UPON THE SAME TREE.

In the Revue Horticole we find an account of a heteromorphous apple-tree, with an illustration which we have thought worthy of having re-engraved for our columns. The tree grows in an orchard belonging to M. Meril, of Deville, near Rouen. It was first observed in 1878, and again in 1880; on the latter occasion, by a mower who was cutting the grass, and who, having stopped under the tree, was surprised to see on it fruits so distinct in form.

The diverse fruits were found intermingled on the branches in the proportion of four or five apples of normal form to one of those recalling a pear. The origin of this singular variety seems to be unknown. It is, however, only the shape of the fruit which is affected, for its character and flavor are those of an apple, and do not resemble those of the pear. This seems to exclude the hypothesis of fertilization by a pear-flower, which many would adopt; probably the tree proceeds from a natural seed, and has always borne fruits thus differing in form, but which have been hitherto overlooked. The tree which has borne these curious diverse fruits is about forty years old.



HETEROMORPHOUS APPLE.—AFTER THE REVUE HORTICOLE.—FIG. 556.

Societies, &c.

NOTES FROM THE ATLANTA COTTON EXHIBTION.

[Rural Special Report.]

Every department of the cotton industry is fully shown at this exposition and none attracts more attention than that of the spool cotton manufacturers. The Willimantic, O. N. T., and Coates Companies have gone to great expense in showing up their different methods for making the fine, linen-finish cottons—bleached, unbleached and in all colors, showing up, in fact, in the main building every thing except the dyeing processes. The rapidity with which the cotton is taken from the field and put through the several processes is fully and thoroughly illustrated. The Willimantic Company has the largest and finest exhibit of cottons and machinery on the grounds. Here we see the Sea Island, or long-staple cotton, which is the only material used in their goods, first placed on the knife cotton gin which grasps the fiber, draws it easily until the seeds reach the edge of a polished pressure bar, where a light blow knocks off the seed, thereby not breaking or straining the fiber. Then the cotton goes to the picker, where after being weighed and distributed upon the feeding apron of the picker to a certain uniform depth to make the required weight, it is rapidly wound into laps which resemble a huge roll of batting. Now the cotton is ready for the cards. Those used by this company are the largest size of any in this country, are of great capacity and contain the latest improvements. From the cards the cotton is delivered to the "railway," and from this it passes to the "railway head," where the band of cotton is reduced in size to the form known as the railway drawing. Next it goes to the comber doubler where several of these drawings are combined together and brought out in the shape of a lap known as the comber lap. Then it is fed into the comber, and though the cotton at this point looks at its best, about 25 per cent of it is taken out as waste, leaving the remainder drawn out in long, fine, strong and perfectly clean fiber. All the short fiber is eliminated as waste and goes off to be sold as clean short-staple cotton. Next the prepared cotton goes to the first drawing frame where the comber strands are drawn eight into one and this finishes what is called the first drawing.

At the second drawing frame, which comes next, the fiber is still further drawn, eight strands into one, each drawing lengthening the strand about in that proportion and condensing the fiber. Then it goes, two strands into one, to what is known as the slubbing frame where it receives its first twist, is still further lengthened, and is wound on a bobbin ready for the intermediate frame where the strands are again doubled two into one, drawn and twisted, then drawn still finer and twisted two into one on the "roving" frame; then it goes to the ring spinning frame where the strands are again spun and drawn two into one in sizes from No. 20 to No. 120 yarn. Here is the point where the drawings stop and the yarn is now in a condition that prevents any further extension.

It is now ready to make two, three or six cord cotton at will, and our readers should remember that two, three or six cord cotton represents the number of strands of the above yarn. Six cord, of course, is the best, as the twist on the six strands makes a more even surface and this thread is especially used for sewing machines, and is much stronger in proportion, and more uniform in size.

The process of making the yarn into cotton is now shown: First the yarn goes to the two-ply doubler where two threads of yarn are wound on a spool. This machine has a very fine device by which, should a thread break, the spool is stopped at once, making it impossible for the yarn to get mixed. After leaving this frame the bobbins are placed on the first twisting frame, where the thread is made into two cord cotton; next it goes to a bobbin spooler where two ply threads are spooled on to new bobbins for delivery to the three-ply doubler which spools the threads up to six cords and has the same device as the two-ply doubler for stopping the machine. Now the threads are ready for twisting and go to the second twisting frame where a perfect six cord unbleached or "gray" thread is completed. There it is reeled off in skeins, and bleached, colored, or finished with Reid's silk or linen finish, which is the celebrated smooth surface that has made these cottons noted all over the world. After the skeins are returned from the finishers, they are placed on the skein spooler and wound on large bobbins, and then comes that interesting machine known as the automatic spooler which puts on 200 yards to the spool at the rate of 120 spools an hour. One operator attends each machine.

Then comes another very interesting machine known as the ticketing machine, which cuts, pastes and puts the label on both ends of the spool at the same time, at the rate of 95 per minute. Then the cotton is boxed and put up in the different shapes to meet the demands of the markets of the world.

In another exhibit one of the spoolers at work, attended by a single operator, spools 6,000 a day, by winding eight at a time. This machine lifts the spool automatically to its position, winds just 200 yards, and, at the right point of time and place, cuts the spool, draws the end of the thread tightly in the slit, cuts it off and drops the finished spool in the tray. Many of the readers of the Rural will probably be astonished to find out the number of processes the cotton has to go through before it is ready for the market, and at the low price it is sold for after all these manipulations; but if they could only see the handiwork of the American machinist, as represented in the improved machinery exhibited on these grounds, they could easily see how it is done. Of all the machinery in this line there is only one foreign machine used, and that is the English knife roller gin used for ginning the long-staple cotton. An improvement will be made on this by some Yankee within a very short time. This exhibition will, from an educational point, be an immense benefit to the Southern people. It will show them what they can do on their own ground, how to keep and manufacture their raw material instead of sending it away from home, and also give them a much needed lesson in what their Northern brothers are doing and have done to create markets for their produce all over the world.

W. H. K.

Miscellaneous.

What Others Say

Mr. J. J. Thomas decides that Lost Rubies, though about the size of Franconia, is unlike it in character. Franconia and Naomi are generally thought to be the same, so that Mr. Thomas's decision is that Lost Rubies and Naomi are different varieties. Mr. Purdy, we believe, does not deem Franconia and Naomi identical, however: so that he may still insist upon the identity of Lost Rubies and Naomi..

Last Winter a writer in the London Agricultural Gazette had 25 lambs out of 140 taken with what shepherds call the white scour, which is very fatal. What comes from the lamb is about the color of soapsuds, and of about the same consistency. He gave each one a tablespoonful of dry common table salt. The next morning all but one were dry; to that one he gave a second dose, and it recovered. He did not lose one. He has used dry salt with calves in scour with the same success.

PROSPERITY everywhere. Truly ours is a favored land. The Pacific Rural Press says: "There has probably never been a more buoyant spirit awaiting the opening of the planting and growing season, and the alacrity with which chosen plans are pushed forward will be charming to contemplate. The State was never in so good shape to go forward. All legitimate trades and industries are alert, expectant and confident. The season has been a good one in trade even during the period when dullness usually prevails, and now that the spell of idleness is broken, the quickening will be general.

ORCHARD GRASS.—Professor D. L. Phares, of the Mississippi Agricultural College, speaks very highly of Orchard Grass:—Of all grasses it is one of the most widely diffused, growing in Africa, Asia, every country of Europe and all of our States. It is more highly esteemed and commended than any other grass, by a larger number of farmers in most countries—a most decided proof of its great value and wonderful adaptation to many soils, climates and treatments. . . . It will grow well on any soil containing sufficient clay and not holding too much water. If the land be too tenacious, draining will remedy the soil; if worn out, a top-dressing of stable manure will give a good send-off, and it will furnish several good mowings the first year. It grows well between 29° and 48° latitude. It may be mowed from two to four times a year, according to latitude, season and treatment, yielding from one to three tons of excellent hay per acre on poor to medium land. In grazing, and as hay, most animals select it in preference among mixtures with other grasses. In lower latitudes it furnished good winter grazing, as well as for Spring, Summer and Fall. After grazing or mowing, few grasses grow so rapidly (three to six inches per week), and are so soon ready again for tooth or blade. It is easily cured and handled. It is readily seeded, and catches with certainty. Its long, deeply penetrating, fibrous roots enable it to sustain itself and grow vigorously during droughts that dry up other grasses, except tall Oat Grass, which has similar roots and character. It grows well in open lands and in forests of large trees, the underbrush being all cleared off. He has had it grow luxuriantly even in beech woods where the roots are superficial, in the crotches of roots and close to the trunks of trees. The hay is of high quality, and the young grass contains a larger per cent. of nutritive digestible matter than any other grass. It thrives well without renewal on the same ground for 35, may 40 years. How much longer the Professor is not able to say. It is easily exterminated when the land is desired for other crops. Is there any other grass for which so much can be said?

THE N. Y. Sun is responsible for the following: "In a recent trial of a butcher for selling bad meat in a town in England, it came out that a great deal of horseflesh was sold to poor people. But the selling of horseflesh as beef was not the worst feature in the case, for it was shown that the horse died a natural death, and was not butchered for his flesh. In commenting on this case an English agricultural contemporary says that it is the practice of some butchers in England to procure aged and diseased horses and slaughter them for food; then, in order to attract custom, they put a low price on the stuff and label it American or Australian beef, on account of its uninviting appearance. This is meanness of the lowest type.

IT is generally maintained, remarks Dr. Voelcker of England, that you can only get richness in the small breeds, like the Jerseys and the Alderneys; and it is generally true that the Alderney and Jersey cows produce richer cream than cows of the larger breeds; but, nevertheless, it is a fact that by proper selection you may get a cow which produces not only rich milk, but also much milk; and on the occasion of the last dairy show there was a Short-horn cow which gained the milking prize, and which not only produced a great deal of milk, but milk that was actually as rich as that of some of the Guernsey cows that were then exhibited.

PROF. ARNOLD in the New York Tribune, says that cows which have a moderate feed of meal while grazing will give more and better milk and hold out longer than those which live exclusively on grass. This is more especially true with large milkers. So large a share of their food is converted into milk that their bodies fail to be properly supported. With such cows a moderate feed of meal daily while at grass gives a fuller development of vigor without undue excitement, and contributes to the duration of the milk-producing function as well as to an improvement in the quality and quantity of milk. Exhaustion, or a failure to fully sustain vital functions, is as fatal to duration as over-excitement or over-exertion, and from this cause more cows have their time of profitable milk-producing shortened from the lack of meal than from getting too much while at pasture.

GETTING RID OF QUACK GRASS.—Mr. Simmons, a member of the Farmers' Club said, according to the Rural Home, that he had a piece of Quack in one of his fields. He planted it to potatoes last year, and cultivated them well, and thought he checked the Quack decidedly. This year he sowed it to oats, grew a very large crop, and could see nothing of the Quack in the stubble. Turned it under and sowed wheat, and cannot, as yet, see anything of the Quack. Mr. Ives did not believe that Mr. Simmons would see much more of the Quack. He had handled a great deal of Quack, and finds it will give in to thorough tillage. The thorough cultivation of the potatoes last year, followed by the Spring crop, and then the cultivation for wheat, when so dry, was hard upon it, and then the wheat will help keep it down.

THE New England Farmer remarks that farmers living near villages can make the most from their hogs if they will retail them out at butchers' prices. It is very seldom that a hundred pounds of cut pork will not bring $4 more than a 100 pounds of whole hog. Salt pork, hams, lard, roasting pieces, head cheese, pickled feet, and the trimmings,

"In linked sweetness long drawn out,"

are always salable in every Christian market, and the different parts are not difficult to cure, while the waste from pork carcass is less than from any other animal, except sardines.

IT says also that a swill barrel on the farm, where every waste substance is thrown to sour and rot, is a piece of furniture that it has little respect for. There is no place for it in the house, nor in the dairy room, nor at the barn, nor have we found quite enough room for it out of-doors. It draws flies, breeds mold and maggots, smells bad, and not unfrequently spoils the good food put into it.

DR. HOSKINS says that he began his present sandy farm fifteen years ago when it was called a "run-out" place, and having chiefly used ground bone and hard-wood ashes as fertilizers, he now has it in first-rate condition. There is not an acre of it that has received this treatment that is not good for two or three tons of hay, 300 to 400 bushels of potatoes, 30 bushels of wheat, or 60 bushels of corn at a crop. Some of the land has never had a particle of stable manure applied to it since it came into his hands, and none has had muck. He uses some nitrogenous fertilizer, usually sulphate of ammonia, with such crops as he thinks need it, but this is applied rather to the crop than to the land, and none is supposed to be left in the soil when the crop is harvested. This work has all been done at a profit. The Doctor is not a "fancy farmer," and has had no money to use except what has come out of the land while in process of improvement. He is still using from one to three tons of bone and all the ashes he can get every year, and is satisfied with this method of farming on sandy land.

THE Sweet Potato must be kept dry and warm, says the Sun, as cold even above the freezing point is often destructive to its vitality. In warm climates it is only necessary to bury the tubers in dry soil in the autumn, in order to have them come out sound in Spring; but in cool climates, as in our Northern States, a little artificial heat during the Winter months is required. Packing in dry chaff or kiln-dried sand is perhaps the best method, after which place the barrels or boxes in a dry room or cellar where a fire can be occasionally kindled to drive out moisture and raise the temperature to 60 or 70 degrees. The tubers will not sprout eve at a higher temperature unless considerable moisture is present in the materials used for packing.

PROPERLY viewed in his plans and objects, says Mr. F. D. Moulton, in the Journal of the American Agricultural Association, the man who does the most to promote the best system of agriculture is a philanthropist who sets an example to every tiller of the soil, stimulating others to accomplish the best results, encouraging all who view his work to aim high, and showing the world how attractive agriculture may be made. Such a man shows his followers how much of beauty and enjoyment may be found in farm life; and when we stop to reflect that agriculture is the great industry of our country, and that more persons are directly engaged in prosecuting it than in all other pursuits, it must be admitted that too much cannot be done to lighten its burdens, to increase its comforts and to improve its products

IN the same Journal Professor McBryde says that there is a weighty reason why the history of agriculture should have a foremost place in the curriculum of the agricultural college. In these days of advanced thought and arrogant self-assertion it is well to compare the pretensions of the present with the deeds of the past. Such study and comparison will almost induce the belief that modern discoveries are but the rehabilitation of truths, or the resuscitation of processes and arts, long forgotten or neglected, and our present civilization simply retrogression towards the primeval. And surely it will make us all the humbler and better to remember that human nature has from the beginning been ever the same; that the mind of man has always been engaged with the problem of his being and surroundings; and that intellects as mighty, and in all probability civilization as advanced, as any our century boasts of, have appeared and disappeared, again and again, since the advent of our race upon earth. * * * After a careful examination of the works of all the old Roman authors, Professor McBryde has but little hesitation in asserting that the agriculture of Rome was characterized by the skill and thoroughness for which her people were so justly renowned, and that it was superior to all but the very best systems of husbandry prevalent as late as 40 years ago, and fully equal to nine-tenths of the present. * * *

Thorough cultivation was always aimed at, and the necessity of manuring well understood. It was held that soils, like animals, needed rest at stated intervals; hence the fallow system was generally adopted, and the land kept clean and mellow during the season by repeated plowings. This fallow formed part of a regular rotation in which different kinds of crops were grown.

Leguminous plants, more particularly the clovers, lucern, sainfoin, etc., were considered especially valuable in such rotations as good preparations for wheat and the other cereals. They were therefore grown for turning under green, as well as for forage, for Columella writes of them as follows: "If the lupins, vetches, lentils, etc., are cut down green and immediately plowed under and covered before they wither, they fully supply the place of barnyard manure." He adds, however, that if grown for their seeds, such leguminous crops as beans, peas, etc., injure the fertility of the soil, and that the only safe and sure remedy in such cases is farm manure. Columella and Palladius both give full directions for the culture of lucern.

Much attention was paid to the making and composting of manure, and the relative amount and value of that voided by the different kinds of farm animals carefully determined. On certain crops it was applied green; for others it was well fermented. The time and mode of application demanded by different soils also received due consideration. Leaves, ferns, straw, the sweepings of the courtyards and roads, ashes, natron, lime and chalk, salt, etc., were all freely used as fertilizers. Burning was another method adopted for improving unproductive fields.

A NEW BLACK CURRANT called Black Champion, raised by Mr. Dunnett, of Dedham, England, is said by the Florist and Pomologist to be the finest variety yet known, being extremely prolific, with large berries, ripening simultaneously in the same cluster. It will be quite an acquisition, the Pomologist thinks, among new hardy small fruits, and will be especially valuable for market-growers, on account of its free bearing habit.

MR. GEDDES (N. Y. Tribune) finds red clover, sown thickly, the very best thing to dispute possession with and keep Canada thistles down. . . Mr. Cheever, of Massachusetts, states that he has kept hornless bulls for the past 15 years, in all as many as eight mature animals, and "not one, as yet, has shown signs of viciousness." . . . . . Experiments made by Professor Beal and reported in the N. Y. Tribune, show that nothing is gained by placing posts in the ground top-end down. . . . . Dr. Hoskins thinks that there is no machine so poorly understood by the majority of those who run it as the plow. . . . . Mr. Cheever says that a carpenter who should use tools as far behind the age as are some of the plows that are still in use, would find it difficult to obtain employment. . . . . Professor S. W. Johnson says that it is often said of a machine that it was good in theory, but failed in practice. This is as untrue as untrue can be. If a machine has failed in practice it was because it was imperfect in theory. It should be said of such a failure, the machine was good, judged by the best theory known to its inventor, but its incapacity to work demonstrated that the theory had a flaw. . . . . Secretary Chamberlain forcibly says, in the Ohio Farmer, that poor soil cannot be brought up to fertility in a season simply by an immense amount of manure, any more than a lean horse can be fattened in a week by an immense amount of feed. The soil needs time to assimilate the manure and improve in texture. It takes time to "fat it up," just as it does to fatten the lean horse. And time requires patience on the part of the farmer. . . . . It is not always safe to give a piece of your mind to an erring friend, because you live so close to your income that any expenditure of that kind may bankrupt you. . . . . One thousand shingles, laid four inches to the weather, will cover 100 square feet of surface, and five pounds of shingle nails will fasten them on. . . . . One fifth more siding and flooring is needed than the number of square feet of surface to be covered, because of the lap in the siding and matching of the floor. . . . . One thousand laths will cover 70 yards of surface, and 11 pounds of lath nails will nail them on. . . . . Eight bushels of good lime, sixteen bushels of sand and one bushel of hair will make enough good mortar to plaster 100 square yards. . . . . A cord of stone, three bushels of lime and a cubic yard of sand will lay 100 cubic feet of wall. . . . . Five courses of brick will lay one foot in hight on a chimney; six bricks in a course will make a flue four inches wide and twelve inches long; and eight bricks in a course will make a flue eight inches wide and sixteen inches long.

Everywhere.

NOTES FROM ARKANSAS.

THIS southwestern land may be considered a land of promise, as its resources in a great measure are yet to be developed. The first really sharp frost of the season occurred on November 20. Our forest trees had previously assumed a golden hue and among our "up-west" mountains the scene for several days past had been beautiful—exquisitely picturesque. Our fruit trees this season are going into winter-quarters with fine prospects for a crop next season, the wood, notwithstanding the warm, wet weather of two months past, having thoroughly ripened, so that all liability to injury from Winter is over. Last year was one of great disaster to fruit trees throughout this State. A Summer and Autumn of showers followed by a fall of temperature unprecedented both for suddenness and severity, destroyed at least fifty per cent of all bearing trees. The damage, however, was confined mainly to low lands. All high points escaped with but slight injury.

The interest in horticulture is destined to grow into immense proportions in this State. That which retards it most will doubtless be overcome in a few years. Men who have already made a success have labored under great disadvantages. First, commencing without capital in the woods, they have had to expend a great deal of capital in the shape of labor to prepare the ground by removing the dense forests of oak and other growths. Second, most men engaging in the business have immigrated within the past eight years with a good knowledge of the fruit business in States north, and have found from experience that the list of varieties with which they had been familiar were largely a failure here. This is so especially with the apple and pear. The writer of this has brought to fruiting more than 100 varieties of apples alone, and now could not recommend for Winter keeping more than one dozen and these mainly of Southern developing. Years of time, toil and labor have been lost. In addition to this want of experience by this first generation of horticulturists, our State legislators fail to give aid or even encouragement to her agricultural enterprises. A young man from abroad goes into a law office and reads six weeks. He looks west to find a suitable location to develop his hidden genius. He has always understood that Arkansas is one great big "mullet-head." He comes and finds that the field for success in his line is preoccupied. He cannot with his limited knowledge of law earn enough to meet his current expenses. He strikes for the legislative halls of the State and by wiring and pulling he gets in. A legal term of 60 days's session is occupied in discussing defunct issues about "*old bonds*" and the embezzlements of former State officials, when a committee is raised at the close of the session and left "*ad interim*" to draw $18.00 a day and contingencies to detect a discrepancy in the Treasurer's books. Thus fifty thousand dollars are expended on discrepancies supposed to exist and the young man returns home, full of currency and self-complacency; exhilarated over the wonderful achievements made and the wisdom displayed at the capitol. Such men are after the "dear people's" money. They get what they are after, and all public enterprises of the State are lagging. An agricultural college in the State educates the sons of *well-to-do* merchants, officials and professionals at the expense of the people of the United States and of the State and returns them to their homes—to do what? Engage in agricultural pursuits after the most modern improved style? No. This is drudgery, only to be performed by the ignorant.

Thus the intelligent farmers and we have many of them—is left without encouragement. That we have resources equal to those

of any and inferior to no other State in the Union cannot be denied. C. H. G.

RURAL SPECIAL REPORTS.

Illinois.

WAUKEGAN, Lake Co., Dec. 2.—I received all the seeds on the 16th of May and planted them next day, excepting the oats and sorghum, which I planted later. I dug the potatoes the 20th of September; they yielded seven pounds. I think they would have done better if I had received the seed in time to have planted them earlier. I planted the Washington Oats and the Branching Sorghum May 26th The oats came up and grew nicely until the 26th of July, when they were badly lodged by a heavy rain and also struck with smut, so they didn't amount to anything. But the sorghum did first-rate. I cut some up and fed it to a cow, with green corn stalks, and she appeared to like the sorghum as well as the corn, so I think it first-rate fodder. I saved 22 stalks for seed, which I think ripe enough to grow, though I think ordinary seasons are too short for it to ripen here. I was much pleased with the dianthus, but the picotees and carnations, which I took especial pains with, proved also to be dianthus. The asparagus seed came up and did well. J. D.

Maine.

WINTHROP, Kennebec Co. Nov. 28.—I planted the little White Elephant about the 20th of May cut into 15 pieces, one piece in a hill, and dug on the 1st of September 43 pounds of nice tubers, eight of the largest weighing 10 pounds; six weighed 6¼ pounds, five, 5½, four, five pounds, three, four pounds, two, 2½, and one 1¼ pounds. The pinks came up well and were the wonder of Winthrop, admired by all. J. S. P.

Maryland.

BURTONVILLE, Montgomery Co., Nov. 28.—We had the driest season for many years. Our hay was good; corn about two-thirds—early good, but late poor; wheat and potatoes about half a crop. Wheat is worth $1.35 @1.50 per bushel; potatoes, $1@1.10; hay, 90c. @1.20 per 100 pounds; apples from $2.50@3.50 per barrel. W. S D.

Massachusetts.

LOCKS VILLAGE, Nov. 21.—From the White Elephant Potato I raised 36 pounds of handsome tubers; all were large enough for table use, one weighing a little over two pounds. From the Washington Oats I raised one-half bushel of nice grain. The asparagus is doing nicely. We have over 100 plants. The Rural Branching Sorghum, I think, is a failure; it grew to be about eight feet high and seeded well, but I think the frost killed it. F. S. MCF.

Michigan.

SODUS, Berrien Co., Dec. 3.—The White Elephant was very small; I cut it into 11 pieces, 10 of which grew and did fairly, producing 57 tubers, mostly marketable. They had a poor chance, as I planted them alongside of, and only 20 inches from, the Washington Oats, which grew so large as to shade the potatoes too much. I saved all and intend to find out next year what there is in them. The Washington Oats I sowed in drills 20 inches apart, two inches in the row; they made a splendid growth, but smutted badly. The drill for about 20 feet was injured by a shade tree and the cows got in and ate off nearly one-third of the heads. I thrashed six pounds of very small seed—not more than half as large as the Boughton raised in the same field. The Rural Branching Sorghum did well. It was planted the first of June. I cut it when about seven feet high, but it was so late as to make only a feeble growth afterwards. I left a few canes of the first growth and have about half a pound of matured seed. The asparagus seed I planted just before a severe drought in the latter part of May, and it was a long time before it came up, but we have between 75 and 100 plants. The drought and neglect nearly caused a failure in the flower seeds, but a few came up and bloomed and were very nice. The drought all through this section was very severe—no rain to do any good for 10 weeks; but since the rain commenced it has been very wet, from the middle of October up to the present time. We have had no severe cold weather yet, the mercury going no lower than 14 degrees above zero; the frost now is nearly all out of the ground; we have had only about two inches of snow. Wheat a light crop; oats good; corn medium; tomatoes were injured badly by drought—only about half a crop, and these are rotted badly. Apples and all small fruits fair crops. I think the RURAL NEW-YORKER the best agricultural paper I have ever read. Long may it live to do good! F. M. B.

New Hampshire.

PORTSMOUTH, Rockingham Co., Nov. 28.—Notwithstanding the very cold, wet Spring, followed by a long, severe drought, I have had some success with the Rural seed. A very small percentage of the Branching Sorghum sprouted; those that did, sent up from a single seed 12 to 16 stalks which grew splendidly and by not cutting back some of it, I am satisfied I can ripen the seed in open field culture. Indeed I have done so this year without transplanting from the house, as our Pa. "brother" did. The asparagus came up well and plants have made a fine growth. Now as to its value, compared with Conover's Colossal for market, do the stalks grow any larger with the same treatment? [We cannot answer the question. We do not know that these kinds (the Argenteuil and Dutch) have been raised in America. Eds.] The Washington Oats grew well but did smut badly, and those that did not, the black birds gathered while in the milk: so ended the crop. The young Elephants did well for the season. I have 52½ lbs. of good, even-sized tubers. In regard to the Perfect Gem Squash: I purchased and planted a packet of seed and succeeded in saving nine plants on which grew 144 squashes. As many as 23 grew on a plant, but they are so small that not one in the lot will weigh two pounds, but quality may offset quantity, for they are first-class—no humbug about it. The late rains and warm weather have put a fine top on our Winter grain. We do not grow much, however, our principal crops being confined to small fruits, melons, etc. Berry crops in this section were good. Asparagus good; but the growth slow, owing to cold; for that reason the prices have kept good. Early potatoes fine; of late kinds none were planted for the grower would have to fight the bugs all Summer. Water and citron melons and sweet potatoes were about two thirds of a crop; but they brought better prices than usual; therefore we get about the same amount of money as usual and there was less labor to market the crops; corn from one-half to two-thirds of a crop. J. S. C.

The Queries.

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention.]

PLANTING BLACK WALNUTS.

C. H. E., Blossburg, Pa., wishing to plant five acres of black walnuts, asks, 1, would they be likely to do well there—plenty of butternuts thrive there; 2, how far apart should they be planted; 3, should the nuts be put in the ground now; 4, would it do to plant them in the garden and transplant them a year from next Spring; 5, would black walnuts pay.

ANS.—1. If the ground is rich they should. 2. Six to eight feet, according to the nature, cleanliness and shelter of your ground. 3. They had better, or you may bed them in earth, sand or sawdust till Spring and then plant them; at any rate, do not let them get very dry at any time before planting. 4. Yes, you may sow them thickly in rows or beds in your garden and let them remain there for one or two years before transplanting them. 5. That depends upon many things. If your ground is poor, black walnuts will grow but slowly in it. European Larch might pay you better. If deep and rich, in so small a plot agricultural crops might be more remunerative. Before setting out a plantation of young trees the ground should be well and deeply worked and cleaned. The young trees should be planted thickly so as to shelter one another and in due time overcome the weeds; but until they grow big enough to be beyond the reach of injury by being choked by the weeds the ground must be kept clean, else success need not be expected. In so small a space as five acres a wooden fence or hedge would be of great benefit in affording shelter, but in the event of large plantations their influence as shelter would scarcely be perceived except in those trees growing near them. But as a young plantation should not be a pasturing field as well, a fence is indispensable. In after years timely attention must be exercised in thinning; the trees should not be allowed to overcrowd one another. The thinnings may be used for fire-wood, light work, as tool handles, fence posts and the like.

MAKING A PERMANENT PASTURE.

E. L. McG., Chestertown, Md., has a piece of land he desires to get into permanent pasture—soil a light sandy loam, bordering on a river, and he asks: 1, what kind of grasses should be sown and how much to the acre; 2, what kind of fertilizers should be used, for the land is too poor to grow any sort of grass without some kind of manure; 3, how long could it be kept as a pasture by means of manuring and top-dressing.

ANS.—It is a poor business to try to get a permanent pasture on poor soil; one might as well try to live luxuriously on hard-tack and water. Good soil is needed, and the common failures of grass-seeding are due to the fact that persons seem to think any kind of land is good enough for grass. Our advice in this matter is: Don't try this plan which is sure to fail unless you wait and get the ground in good condition; but try the following: Plow the ground early in the Spring and plant corn in rows as usual, but close in the row; use 300 pounds per acre of good artificial fertilizer or as much wood ashes as you can get. When the corn is in tassel plow it under, across the rows, using a chain on the plow to draw the corn into the furrow. Then harrow repeatedly to kill weeds, but with a light harrow and with sloping teeth so as not to disturb the corn. In August or September, early, sow rye, with six pounds of Timothy, twelve pounds of Red-top, five pounds of Yellow Oat Grass, five pounds of Meadow Fescue, and 12 lbs. of Kentucky Blue Grass per acre. When the rye is high enough pasture it down in the Fall, and pasture it close in the Spring, and keep it pastured. In the meantime the grasses will be coming on and in the Fall will occupy the ground. Then keep the grass top-dressed with fine compost each year until there is a good sod. With care you can have a good permanent meadow. It costs—but then so does every good thing.

A. C. H., Roanoke, Ind., asks, 1, where can he get Canada or field peas; 2, how do they compare with corn as hog feed; 3, a remedy for kidney worms or "weak back" in hogs—a neighbor recommends arsenic.

ANS.—1. Seed peas are usually obtained from Canada where they are much freer from the fly than in the States. The soil and climate in the Dominion seem to be peculiarly adapted for growing peas and large crops are produced. R. H. Allen & Co., 191 Water St., New York, always have them for sale and we presume large Western seed dealers in Chicago, Detroit, Indianapolis and other places also keep them on sale. 2. Peas are better for fattening pigs than corn, as they are not so heating and consequently not so liable to produce inflammation of the stomach and bowels. Pigs will fatten as fast on peas as on corn. 3. The most effectual remedy for "kidney worms or weak back in hogs" is spirits of turpentine. It should be rubbed on the loins and administered at the mouth; dose, from a teaspoonful to a tablespoonful diluted in milk. The dose should vary according to the size of the pig. Two or three doses given every other day with the outer application, will generally suffice. We would not recommend arsenic.

HOW MANY TONS OF HAY IN A MOW?

J. R. B., Rillman, O., asks for a rule for measuring hay in the mow. He has heard of one which says that 8x8 will make a ton of Timothy, 8x9 a ton of clover and Timothy and 8x10 a ton of all clover.

ANS.—Your rule would be nearly right if you had made it 8x8x8, that is, 8x8=64x8=512 cubic feet, which is the normal quantity estimated for a ton of Timothy hay in a mow or stack. If hard-pressed by grain on the top, or if in the bottom of the mow, or if loose, allowance must be made; about 600 cubic feet of mixed Timothy and clover, or 8x9x9, and 800 feet of clear clover or 8x10x10 are the usual estimates. Varying circumstances must be allowed for, as they may affect bulk and weight. A common rule is: Multiply the length in yards by the hight in yards and that by the width in yards and divide the product by 15; the quotient will give the number of tons.

WINTER FEED FOR SHEEP.

J. M. C., South Jefferson, N. Y., asks what would be a good feeding ration for 30 ewes from one to three years old, of a medium grade of wool, and that are to drop their lambs after the middle of March—is barley a good grain to feed.

ANS.—For each ewe, one pint per day of mixed corn, oats, rye and buckwheat in equal quantities will make a cheap and good ration. Occasionally the same quantity of wheat bran may be given for a change. Clover hay should form the staple feed, and about three pounds per head daily will be required. Barley is too dear a feed for sheep. A feed of oat straw is relished now and then.

Miscellaneous.

A. J. A., North Paris, Me., sends for name two apples, both of them Fall apples—one, sour and red-striped, ripens in September; the other, a sweet apple, ripens later on.

ANS.—The apples were forwarded to Mr. Charles Downing, who replies:—"I do not recognize either as any kind I am acquainted with, except the sweet apple may be "King Sweet," which originated in Sidney, Me., where it is highly prized for its rich, honey sweet flavor. It is some time since I saw the apple, and I may be mistaken. The specimen is over-ripe and has lost its best flavor. The striped apple is also over-ripe and has no flavor left. I do not know it from its appearance." In this connection let us again state that fruit to be sent by mail should not be sealed or pasted or sewed. The spaces around the fruit should be filled closely to prevent it from shaking and bruising. These apples were very much bruised and spoilt.

A. C. H., Roanoke, Ind., asks where ozier willow cuttings may be obtained; 2, are they tough enough to tie corn fodder; 3, what will render a rather flat, new, pine shingle roof most durable—coal tar? 4, how to make manure pots intended to dissolve and gradually fertilize the melons, etc., planted in them.

ANS.—1, From A. J. Hinds, Patchogue, Long Island. 2, Yes. 3, No, not coal tar, but a coat of mineral (oxide of iron) paint and boiled oil. 4, Take good garden loam and cow dung clear of litter, except a little chopped straw. Mix these into a thick paste, working it until it is tough; then mold it into a rough sort of pots and put them to dry in the shade and a cool but frost-proof place. These melt down when put in the soil.

L. D., Belmont, Nova Scotia, asks for good recipe for water-proof blacking for boots and shoes; 2, is ozone as good a food preservative as the Prentiss Preserving Co. say it is; 3, would it be well to haul swamp muck this Winter on to an onion-bed on which onions have been grown for three years, and which has been manured and plowed this Fall, the muck to be used as a top-dressing in Spring and well harrowed before the seed is planted; the best commercial fertilizer for onions.

ANS.—1. See Domestic Economy. 2. See Prof. Warder's article last week. 3. It is impossible to say, so much depends on the quality of the muck. 4. We would as soon use bone flour as anything.

A. J. R., Harper, Kansas, asks the name of a manufacturer of water-wheels suitable for a small stream. There is a fall of 15 feet, and the stream would fill a three-inch pipe.

ANS.—For water-wheels write to the Leffel M'f'g. Co., Springfield, Ohio, who will send a circular giving information about powers, etc. Your water supply is too small, however, to do any work of the kind. The whole contents of the 15 foot, three-inch pipe would be less than one cubic foot, weighing less than 60 pounds, which would give scarcely power enough to turn a wheel without doing any work. By making a dam and collecting the water you might do a little work once a month, perhaps, but would that pay you?

J. W. B., Girard, Kansas, asks, 1, is there a hay loader that will lift hay or millet from the windrow to the wagon; 2, where can Bermuda Grass seed be obtained.

ANS.—1. Yes; it is the Forest Hay Loader, made by the Keystone M'f'g Co., Sterling, Ill. 2 Seed of Bermuda Grass seldom if ever ripens in any part of the United States, and it cannot, therefore, be obtained. Instead of seed cuttings of the roots are sown. These can probably be obtained from either P. J. Berckmans, Augusta, Ga., or Dr. W. B. Jones, Herndon, Ga.

J. C. A., Winchester, Ill., says he does not care much for hollyhocks and celery, and would therefore like to obtain from the Free Distribution an extra quantity of wheat and corn instead of these.

ANS.—We would gladly oblige our friends by complying with such requests were it possible; but in view of the extra labor such selections would entail in so vast a distribution, to do so would be really quite impracticable.

A. J. R., Kansas, and many others desire to know where the seeds of the Rural Branching Sorghum may be obtained.

ANS.—We can only answer that, if seed can be procured, leading seedsmen will offer it for sale. At present there seems to be some doubt as to the supply.

W. D. Van S., Old Chatham, N. Y., asks whether Molds and the Norway Oats are identical.

ANS.—We believe Mold's Ennobled Oats are an improvement upon the Black Tartarian by selection and by other means which Mr. Mold holds as a secret.

J. H. G., Salina, Kansas, asks where he can get Witch Grass seed.

ANS.—We are not aware that seeds are anywhere offered for sale.

W. C. G., Mentor, Ohio, asks what nursery has control of Fay's Currant.

ANS.—G. S. Josselyn, of Fredonia, N. Y., we believe.

W. B. S., Melrose, N. Y., asks where cotton-seed meal is for sale in this city, and its price.

ANS.—Hollister & Co., 92 Broad Street, New York; price about $35 per ton.

What constitutes a well-regulated farm? is the query propounded by E. W. G. to RURAL readers.

THE
RURAL NEW-YORKER,
A National Journal for Country and Suburban Homes,
PUBLISHED EVERY SATURDAY.
Conducted by
ELBERT S. CARMAN.
Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, NEW YORK.

SATURDAY, DEC. 17, 1881.

WE hope our readers will not neglect to put their implements and farm tools of all sorts in good repair. Farm implements are expensive and the farmer cannot *afford* to neglect them. Neither can he afford to tinker over a broken seed drill, mower, harrow or cultivator when it is needed for use, and every hour is more valuable to him than three hours are at this season. Paint or oil the frames of harrows and all exposed iron-work. Sharpen the knives, oil the bolts and screws of those parts which need to be removed. We have known farm hands, when work was most pressing, to spend an hour in vainly endeavoring to loosen a screw. Certainly it is poor economy not to attend to such matters during the dull season.

WHILE the present high price of butter is very satisfactory indeed to farmers and dairymen, there is one drawback attached to it which should not be lost sight of. Although the exports of oleomargarine fell off from 5,999,036 pounds between May 1 and November 23, 1880, to 4,220,573 pounds during the corresponding period this year, still the manufacture of the stuff, instead of diminishing, has increased. Good butter at 35 to 45 cents per pound is beyond the reach of the laboring population as well as of the vast majority of the salaried classes and of the population of towns and cities. These will have "butter," however, even if in the shape of oleomargarine, butterine, or the adulterated dairy product which there is reason to believe is becoming far commoner than in the days of cheap butter. There is little doubt that the high price of genuine butter is very favorable to the extensive sale of the spurious article, and when the price of the former sinks, as it must inevitably do in the course of time, it is likely to find in the latter a much more formidable rival than heretofore on the tables of the working classes—the vast majority of the population.

AMONG the 350 bills introduced in the United States Senate during the four days' session of the past week, two introduced by Senator Plumb of Kansas are of special interest to agriculturists. The first provides for the forfeiture of lands granted to railroads that have not been completed within the time specified in the act of incorporation, and for the opening of these to public settlement. The passage of this bill would restore to the public domain many million acres of unearned land now controlled by unfinished Pacific railroads. The second bill introduced by Senator Plumb provides that all lands granted to railroad companies under the original Pacific Railroad act of July 1, 1862, and all acts amendatory thereof, and to which the companies would have become entitled on payment of costs of surveying, selecting and conveying, shall be subject to all legal taxes, the same as they would have been had such costs been paid and the lands conveyed to the companies. Under existing laws lands granted to railroads are exempt from all taxation until surveyed and conveyed to the companies, and in order to avoid taxation these have been deferring the transaction. Efforts have been made in previous Congresses to pass a bill of this kind, but railroad influence has always been too powerful.

As we have endeavored in every way to engage the interest of our readers in the progress of the RURAL NEW-YORKER we propose from now until the end of the subscription season to furnish an *accurate* monthly statement as to the increase or decrease in our circulation for 1882. We say "accurate." Possibly many of our readers would rely upon any statement we might make without this emphasis. Still, as a rule, we have not found publishers' and editors' statements trustworthy when touching upon this vital question of circulation, and we know of one monthly agricultural journal that, though it has been "doubling" its circulation for many years, has at this time a smaller circulation as a matter of fact than it had five years ago. As evidence of our desire to be trustworthy in the statements we propose to place before our subscribers, we beg to say that our subscription books are at any time open for their inspection. Beginning with November, we find that our list shows an increase of thirty-three-and-one-third per cent over November of 1880 and three subscribers over. We may say that during the entire year not a single copy of the RURAL NEW-YORKER has been sent out that has not been applied for, except the Fair Number, unless it may be to personal friends of the editors or clerks or to advertisers whose attention has thus been called to special articles or to advertisements. We shall make our next report early in the New Year, for the present month.

OUR AGRICULTURAL EXPORTS.

THE amazing growth of the export of provisions and breadstuffs during the past few years is beyond doubt the sufficient cause of our agricultural and industrial prosperity. For the past six years our exports of wheat have been greater than during the previous fifty years, and they have nearly trebled in amount during those six years. In 1876 we exported fifty-five million bushels of wheat, and in 1881 one hundred and fifty million bushels. Of wheat and flour the exports were in 1874 equivalent to seventy-five million bushels, valued at $93,000,000, and in 1881 to one hundred and eighty-five million bushels worth $211,000,000. Adding the value of corn and meal to these figures we have the magnificent sum of $280,000,000 as the product of the export business of 1881 in these staples alone.

This vast sum by no means represents the actual pecuniary benefits which we as a nation have enjoyed. This business thus created has been like a rushing torrent, which down its lengthened course from the far West to the extreme East, has been harnessed to many industrial enterprises and has been turning this wheel here and setting in motion the boom of industry in this place, and then passing on to turn another there, and so on everywhere. In a thousand ways has labor been put in action for the production of wealth. Every dollar of this money has gone into the hands of industrious workers, has passed from them to others, and by a never-ending circulation has comforted and enriched thousands who have never recognized the source of the blessing.

OUR MERCHANT MARINE.

THE position which America has taken in the carrying trade between this and foreign nations is far beneath her dignity as a great commercial country. While our foreign commerce has increased nearly a hundred per cent. within the last fifteen years, it is now principally carried on in foreign ships. In 1856 the tonnage of foreign vessels entered at seaports of the United States was 3,117,034, and in 1881 it is 12,711,392 tons—an increase of 308 per cent., while American tonnage entered for foreign ports, in 1856, was 1,891,453, and in 1881 it is 2,919,149 tons—an increase of only 54 per cent. The ascendency of the British merchant marine service may be noted in this connection. Of the total foreign tonnage entered at our ports during the last fiscal year *i. e.* 12,711,392 tons, England entered 8,457,797 tons—or over 66 per cent. of the whole. Her system of paying large subsidies to various steam-ship lines to carry her freight and mails has resulted in giving her far more numerous and finer steamers than are those which fly the American colors.

In a series of resolutions passed by the Tariff Convention recently held in Chicago, bearing upon this question, two important recommendations occur. First, that American vessels should be made the carriers of American mails at rates proportionate to the value of the service performed, regardless of the rates that foreign subsidized vessels may ask for carrying them. Secondly, that the United States should discriminate in favor of American vessels so that they may enjoy a fair and lucrative share of the carrying trade proportionate to the dignity and power of the country in other respects. These resolutions will doubtless have weight with our national legislature now in session when the subject comes up for consideration. It is hardly conceivable that this country, with more miles of seacoast, with better harbors and ports, and with greater facilities for the establishment of a superior merchant service than any other, should, in the last fiscal year pay the immense sum of $110,000,000 to foreign vessels for transporting our merchandise; but such is the fact.

Even old, sleepy, opium-eating China, one of the least progressive nations of the globe, is bidding for her share of the carrying trade. Last week the first of a regular line of Chinese steamers entered the Thames with flying colors. Thus, under her own flag, China is shipping her products to England, and will, doubtless, in a few years send out her own vessels in large numbers to our shores. On the other hand, America, generally energetic and progressive, sits quietly by and allows other nations to send their craft hither to be laden with the rich products of our fields and factories, and does naught to regain even an honorable position on the high seas where once she was accustomed to acknowledge no superior.

BREVITIES.

ALL who desire that their children should love flowers and learn something; all who are in favor of improving the country school grounds should read the article by Mr. S. Q. Lent, in this issue.

PROF. JOHNSON gives this definition of the art and science of agriculture. The *art* of agriculture consists in certain practices and operations which have gradually grown out of an observance and imitation of the best efforts of nature or have been hit upon accidentally. The *science* of agriculture is the rational theory and exposition of the successful art. Other qualifications being equal, the more advanced and complete the theory of which the farmer is master, the more successful must be his farming. The more he knows, the more he can do. The more deeply, comprehensively and clearly he can *think*, the more economically and advantageously can he work.

THE delegate to Congress from Dakota proposes to introduce a bill providing that any person who shall sink an artesian well in that Territory in such a way as to produce an abundant flow of water upon any part of the unoccupied lands, shall be entitled to 640 acres of such land. Should the proposed bill pass, its provisions will, of course, be so modified as to be applicable to all the Western arid region. The worst of all such measures is that while they are always ostensibly in favor of the agriculturist or herdsmen, experience has shown that they are, in reality, nearly always prompted by capitalists who in nearly every case derive the lion's share of benefit from their adoption.

EARLY in the season the failure of the corn and cotton crops in Barnwell County, South Carolina, threatened the farmers with bankruptcy and ruin from which they have been saved by the success of a new industry forced upon them by their mishap. After the ruin of corn and cotton by the drought, when the rain came on Crowfoot Grass started a fine, spontaneous growth, and from it farmers have gathered a fine hay crop of excellent quality. Moreover, many of them plowed up their damaged corn and cotton fields and sowed oats which has turned out a fine crop. These two crops have lifted the farmers out of their extreme trouble and will in future be much more extensively cultivated. There certainly is such a thing as a blessing in disguise.

PROFESSOR F. B. HOUGH, head of the Division of Forestry of the Department of Agriculture, has just returned from Europe where for the last seven months he has been studying the operations of the schools of forestry in various Continental countries. Having brought back a large collection of material, he intends to make recommendations to Congress for planting and preserving forests on the prairie and desert lands of the West. In view of the rapid denudation of our timber lands by fire and the woodman's ax, prompt and efficient measures should be at once adopted to prevent the wasteful destruction of our forests and to provide for the growth of timber to replace that cut for industrial purposes.

OF the public lands ten million acres passed from the control of the government during the past fiscal year into the hands of settlers and corporations. Moreover, eight hundred thousand acres of Indian lands were sold and the price—a trifle over a million dollars—was placed in the Treasury for the benefit of the Indians. Of this vast area of land, more than twice the size of Massachusetts, only about five million acres—less than half—are credited to "homestead entries." Most of the rest was disposed of under various statutes which will enable its owners to hold it for high prices in large blocks without actual settlement. The railroads, of course, grabbed immense slices, the Pacific roads alone obtaining 200,000 acres. With such wholesale squandering of the public domain, little of it, if any, of agricultural value either for pasture or tillage will remain in a few years.

AT a largely attended meeting of the National Cotton Planters' Association held at Atlanta, Ga., on Wednesday last, December 7, Commissioner Loring delivered an address on the mutual relations of American industries. The home consumption of cotton during the past decade has increased 828,741 bales, the total during the past year having been 1,938,937 bales. It is a matter of no small importance that we should increase the domestic consumption of the staple, inasmuch as the loss on American cotton sold in England is about two cents a pound, due to freight, port charges, loss of weight in bagging, etc., and the Commissioner says the average price in the American market in 1880-81 was nearly two cents in favor of the producer—an important difference that must increase as the demand enlarges. The remark that the Cotton Belt needs a variety of crops to employ its vast area to the best advantage was met with universal applause. This would indicate that the necessity of the more extensive cultivation of other crops with cotton, is being realized throughout the Cotton States.

DURING the present session of Congress it is likely more than usual attention will be given to the subject of opening up the Indian Territory, or at least a part of it, to settlement. The irrepressible Captain D. L. Payne, however, has anticipated Congressional action, and at last got as many as about 5,000 settlers into Payne County, Oklahoma. These men have been despatched chiefly from Texas across a strip of the Indian Territory 55 miles wide, and are taking up claims and building houses as fast as they can. It is expected that the county will be fully organized and county officers elected within a fortnight. The site of Oklahoma City is one of great beauty, with springs, natural groves, etc, descending gently to a square of 15 acres on the center. Payne, as our readers know, has made several desperate attempts to colonize the rich, pleasant valleys of Oklahoma, but has been prevented by the United States troops, arrested, imprisoned and fined; but the present settlement does not expect to be molested by the government or Indians.

GREAT BRITAIN, the champion of Free Trade, levies a tax "for revenue only" on importations of some kinds of foreign goods—generally those which are commonly known as "luxuries" or "non-necessaries," among which is tobacco. By an act of Parliament of March 27, 1863, a duty of 3s. 6d, or 85c, per pound is imposed on unmanufactured tobacco in the ordinary state; if it contains more than 10 per cent. of moisture, the duty is 3s. 1½d. Since 1863 the imports of this commodity have largely increased, the revenue from the unmanufactured tobacco having grown from $157,649,734 for the five years 1864-1868, to $218,529,838 for the five years 1873-1877, according to late parliamentary returns, and the quantity from 181,941,105 pounds during the former period, to 255,717,459 pounds, during the latter. In addition to this, 2,065,600 pounds of manufactured tobacco and cigars were imported, the duty on the first being 4s. 6d, or about $1, and that on the second, 5s. The vast bulk of these importations are from this country, so that it is calculated that the revenue of the United Kingdom receives upwards of $40,000,000 yearly from the customs duties on American tobacco

IT is understood that several bills will be introduced during the present session of Congress providing for the enlargement of the scope of the Department of Agriculture in accordance with the views of Commissioner Loring, as condensed in a RURAL "Brevity" in our issue of December 3. The same opinions are urged at length in his late report to the President. The enlarged Department is, according to the latest accounts, to be called the Department of Agriculture and Statistics, and the Commissioner will organize a Bureau of Geological Survey; a Bureau of Transportation, for the collection of facts relating to the cost of "plant" and construction, rates of freight and fares, and such other information as may be important to the industries of the country; a Bureau of Manfactures for the collection of statistics of the cost of manufacture, persons employed, amount and nature of raw material, etc, and a Bureau of Education and Labor. It is not proposed to change the organization of the Department, but to add to it the above Bureaus representing industries connected with agriculture—more or less. If the enlargement shall be made, the head of so important a Department will, as a matter of course, soon take a place in the Cabinet, so that nothing is at present to be said on this matter.

AMONG the cotton mills of England there has been for some time a good deal of complaint of dishonest practices in packing American cotton. Sand and other foreign matters have, it is said, been largely used in the bales to add to their weight. Another mode of swindling is reported to have been lately detected at Oldham where a company that receives large consignments of cotton from this country determined to test how far dampness had been employed, and the staple having been dried, it was found to have lost seven per cent of its weight. So much excitement has been caused by swindling in baling American cotton that the manufacturers have petitioned government to give more encouragement to cotton raising in India so that the English mills may be less dependent on the American product. While emphatically condemning all dishonest packing at home, we would gently remind our transatlantic cousins of the loud complaints that have been repeatedly made of the various adulterations of cotton practiced in times past by the wily Hindoos. Hasn't there also been a great deal of complaint about the dishonest practices of British cotton manufacturers in "adulterating" the manufactured goods for the foreign and especially the "heathen" market?

IT is officially announced that the authorities know of 520 agrarian crimes committed in Ireland during the month of November. They range from the murder of an agent or process-server, to the maiming of the cattle or the burning of the grain stacks or hay mows of some farmer who had incurred the enmity of his neighbors by paying long-due rent or taking a farm from which the former tenant had been evicted. A Property Defense Association has been formed by the landlords, and the English people are entreated to support it by liberal contributions. So difficult is it to obtain a conviction of notorious offenders in the island, that it is proposed to try in England those accused of agrarian crimes in Ireland. But witnesses to convict are as hard to obtain as juries, and how are these to be provided? There is a report that the government offers a reward of $500 and the faithful concealment of the informer's name, to every one who will furnish evidence enough to convict in case of agrarian crimes; but it is hardly likely that the government would offer such an inducement to cowardice, treachery and perjury. It must be borne in mind, too, that every petty trouble in the obscurest Irish village or bog is at once heralded to the world as "Another Irish Outrage."

Biographical.

THOMAS ALVA EDISON.

WHILE MR. EDISON has, as yet given to the agricultural interests of the country but little, if any, direct benefit from his inventions, agriculturists, as well as others, will doubtless like to know something of the man and of his works; so we present, in connection with his portrait, a very brief and necessarily incomplete sketch of his eventful life. Thomas Alva Edison was born February 11 1847, at Milan, a little villag in Erie County, Ohio. His boyhood life was largely spent at Port Huron, Mich., whither his parents had removed shortly after his birth. He early manifested a desire for a letter education than the obscure country village afforded, but the moderate circumstances of his parents forbade his seeking knowledge in the higher schools, and, like many another youth, he found his best instruction in the few books at his command.

Young Edison early manifested a love for experimenting, his first attempts in this line being made on the incubation of goose eggs. At 12 years of age he became a train boy on a railway in Michigan, and when not peddling peanuts, candy and papers to the passengers he was experimenting in the rudiments of chemistry in the baggage car. One day the car caught fire, presumably from his chemicals, and his experimentation was brought to an abrupt end. After this he set about acquiring practical knowledge in telegraph offices, railway shops and newspaper press rooms. He seemed to have a peculiar liking for telegraphy, and for performing experiments in electricity, and while employed as a regular telegraph operator on the line, he was ever on the lookout for possible improvements in the art. A fortunate circumstance at last brought him into fellowship with the Western Union Telegraph Company, so that he had broader opportunities to improve his talent for investigation and invention, and now Edison, though only 34 years of age, has given to the world numerous testimonials of his indefatigable energy and perseverance, and his name, in connection with the electric light and Menlo Park, is now of world-renown. To give a list of the patents Mr. Edison has already taken out for inventions in telegraphing or telephoning, in electric lighting and the transmission of electric energy, would cover a page of the RURAL NEW-YORKER, and yet his brilliant inventive powers seem but to gather new strength with each new conception wrought into practical use.

THOMAS A. EDISON.—Fig. 557.

Miscellaneous.

FERGUS FALLS, MINN.

An Important Grain Market---Magnificent Water Power--A Growing City.

MESSRS. HOLMES AND SWEETLAND.

[Special Correspondents of the RURAL NEW-YORKER.]

AGREEABLY to the promise made in our last letter, we will furnish the many thousand readers of the RURAL with an epitome of the growth, improvement, present prospects and various elements of real worth which came under our observation during our short but pleasant visit to the city of Fergus Falls.

It has increased in population from 1,635 in 1880 to nearly 3,000, dwelling houses and places of business being built much faster than they can be painted and finished. The principal part of the population is American, many from New England. We found a handsome school building costing $6,000, graded with five departments, and were not surprised to learn that it was inadequate, $15,000 in bonds having been voted for a new brick school-house to be built in 1882. More churches than are usually seen in a new Western town turn their graceful spires heavenward here. The societies represented are Congregational, Presbyterian, Episcopal, Methodist, Swede Baptist and Norwegian Lutheran. The press is able, conservative and fearless. The Journal, both weekly and semi-weekly, has a power press run by water. The Independent is also semi-weekly and weekly—both are 7-column folios. The Normanna Banner is a Scandinavian weekly. The various secret societies have prosperous lodges, numbering among their members many of the leading citizens. The railroad interests of this city are doing much toward its rapid development. It is the terminus of two divisions of the St. Paul, Minneapolis and Manitoba Railroad, having, of course, round-houses, machine shops and division offices. It is also an important point on the Fergus Falls and Black Hills division of the Northern Pacific, almost completed, with a branch of the same road from here to Pelican Rapids, and the prospect of still greater progress another year.

Fergus Falls is upon the Otter Tail River, which merges into the Red at its junction with the Bois de Sioux, and boasts

THE FINEST WATER POWER

in Northwestern Minnesota; the natural fall within the city limits and vicinity exceeds 85 feet, and maintains a remarkable uniformity of stage, never varying a foot in its rise and fall. The present development is from three crib and bent dams furnishing 4,000 horse power, of which only about 700 is now used by the present manufacturing interests. The power is held for sale or lease in any quantity desired, with or without building improvements, and its early utilization portends a large increase in the business importance as well as population of the city.

We learn that Mr. Jas. H. Hill, President of the Manitoba line, has, since our visit, made some large investments in the power, with a view to improve it immediately.

The present manufacturing interests of the city are: The Red River roller flouring mills, of large capacity, working now both night and day, and still unable to supply the demand; two other large flouring mills, the three turning off 550 barrels of flour daily; a large saw-mill, capacity 30,000 feet daily, whose business for the year just past has been $84,950; two furniture factories, a wool-carding mill, a foundry, one plow shop and two machine shops, while openings present themselves for almost any branch of manufacturing interest, especially paper mill, flax mill, tow and oil, agricultural implements and oat meal mill.

The value of permanent improvements for the year ending October 1st, is estimated at above $300,000, fully $50,000 of it being in manufacturing industries. The commercial business, carefully estimated, foots up $2,000,000. The banking capital is $75,000; the exchange business is very large and the bank is a credit to the city.

The only hall is Sundhall's Opera House, 50x75, with stage and scenery. Fergus Falls needs a large hotel very much indeed, and we hope on our next visit to see one, as well as some very necessary improvements in the post-office. The city indebtedness is bonded $3,000 at 7 per cent. There is a storage capacity for 168,000 bushels of wheat, which will doubtless be augmented the succeeding year. Too many of the structures are frame, especially as we are told that brick clay of fine quality is found near at hand.

Fergus Falls is the county seat as well as principal city of Otter Tail County, 186 miles from St. Paul, in the western part of the Park Region, where it merges into the Red River Valley. This county is an exceptionally fine agricultural district, being dotted with many lakes, furnishing pure water for stock and abundant precipitation during the short nights of the growing season. Thus, with a rich surrounding country, capable of producing both grain and stock, good railway facilities with outlets in all directions, the water power mentioned, and the right kind of citizens, we see no reason why Fergus Falls should not continue to hold her place in the front rank of Northwestern cities.

THE series of Bonanza farming articles with original illustrations will be begun the last of the year or the first of the New Year.

THE TUBE WELL TROUBLE.

THE uncertainty of the law is proverbial and judging from the very curious and unexpected decisions often given in patent trials, of all forms of law the patent laws seem the most uncertain. Owing chiefly to this uncertainty it is seldom that a real friend advises recourse to the law unless in an important case; for besides being uncertain, the law is very expensive, and here again of all forms of litigation that about patents seems to be among the most burthensome. In the case of the patentees of the driven well against Theodore S. Carman (really against the Pump Manufacturers' Association), decided by Judge Benedict, in April, 1876, in the U. S. Circuit Court for the Eastern District of New York, the plaintiffs' taxed costs amounted to $3,070, which the defendents had to pay in addition to their own costs which were, at the very least, as great. This was the expense of a trial merely in the United States Circuit Court, from whose decision an appeal always lies to the United States Supreme Court, and of course a patent appeal is always more expensive than the first trial. Where the case is not so vigorously contested the costs, of course, are lighter; for instance, in the case of the same patentees against George B. Wright, decided by Judge R. R. Nelson, in 1878, in the U. S. District Court for Minnesota, the plaintiffs' taxed costs were only $622.40, which the defendant had to pay in addition to his own, together with $15, in contesting which all the expense was incurred. Had Wright paid a royalty of $5 at the outset all the worry and expense of this preliminary trial would have been avoided, besides the far greater worry and expense of the appeal, which we understand has been made in this case to the United States Supreme Court.

But here Wright is merely the representative of upwards of a million driven-well owners who are harassed by the exactions of the patentees of this well, and accordingly his troubles and expenses are lightened on account of being shared in by most of the well owners of his State. While litigation, like war, should be avoided whenever honorably possible, still in both cases it often happens that while the immediate cause of one or the other appears trivial there is back of it a principle in support of which the money of the public or the blood of the nation should be freely expended. The American people are steadily opposed to this driven well patent which seeks to tax one of the great necessities of life—pure water. They are impatient of the idea of paying to extortionate strangers a tax on the water they get out of their own wells. Such earnest, widespread movements of public sentiment are never dishonest, and in a Republic, where the voice of the people is paramount, must always have a dominant influence on legislation. Nothing has ever impressed on the American people the necessity of an amendment of our patent laws so forcibly as has this driven-well agitation.

With the exception of four States and a few counties, W. D. Andrews & Bro., of this city, jointly with Green, own the tube well patent in all the States. They sell no patent rights, but grant licenses for wells either directly or through agents. Before the United States Senate Committee on Patents, Mr. W. D. Andrews declared, in March last year, that it was their intention thenceforth to press vigorously their claims for "royalty" in every part of the territory in which they still owned the patent, and that those who owned it elsewhere were in full sympathy with them in this and other matters. The increased agitation since then shows that the above declaration was not an idle threat. If the patent remains valid every driven-well owner in the country will soon be forced to pay from $5 to $10, or as much more as the patentees or their agents may, later on, choose to exact, for every 1¼-inch well, and a greater sum for larger wells. It, therefore, behooves every man who owns, or may hereafter own, a driven well, as well as all haters

of patent extortions, to show interest in this question not only by supporting an amendment of the patent laws, but also by contributing to the cost of a test case as to the validity of the Green patent for this *process* of well-making. His patent is not on any device, but on the *process*. There are upwards of 150 patents on various devices for executing the process, which cannot be done without infringing on one or more of these auxiliary patents, so that, in addition to the tax payable to Green for the *process*, every well owner is liable to be forced to pay another tax to one or more of these other patentees for the "points," "filters," "drive-heads," etc., needed to render that "*process*" effectual. The validity of this and all other patents is ultimately decided only by the United States Supreme Court. The decisions of the examiners of patents, of the Commissioner of Patents, of the U. S. Court of the District of Columbia, and of the U. S. Circuit Courts, all of which have decided on this subject, do not settle the matter. That can be done only by the court of final arbitrament—the U. S. Supreme Court. Once that has decided, either all harassment from the patentees or all objections from the well-owners must cease.—To be continued.

The Apiarian.

HONEY REPORT FOR 1881.

G. M. DOOLITTLE.

WINTER seemed loath to give place to Spring so it was April 20th before our bees had a chance to fly to any amount. At this time I found the severe Winter had made sad havoc with the little laborers, and above half of them were unable to respond to the roll-call, while many colonies were so weak as to be of little value unless united with others. When I had finished uniting I found I had just 30 colonies left to commence the season with.

May 1st pollen came in quite plentifully from elm and soft maple, and the bee season of 1881 was fairly commenced. Golden Willow bloomed May 12 and invited the bees to a feast of new honey, an invitation they were not slow in accepting. On the 21st the odor of apple blossoms filled the air, and prepared for the bees another banquet. The month of May was very warm and consequently white clover commenced to bloom about the 1st of June—nearly 15 days earlier than usual. I expected much from this source as it was uncommonly abundant (owing to the steadily cold Winter); but I was doomed to disappointment, for on the 5th the weather changed and the morning of the 6th found everything white with frost. Cold, wet weather followed with more frost, and not till the 29th did the weather become favorable so the bees could work to any advantage. By this time the clover bloom was nearly past; but we succeeded in obtaining a small surplus just at the last.

Basswood opened July 8 and yielded very sparingly for about eight days. Basswood is our main dependence for a honey crop, but at its close this year we had taken scarcely a box of honey, and feared the honey season was to be a failure in this locality. Red clover had failed to blossom here for some years, so I was quite surprised in the latter part of the basswood season to see the fields growing bright with bloom. As the bloom increased and continued, we began to hope we might yet obtain some surplus, but had no expectation of the yield we really obtained. The few acres of teasles within reach of our bees commenced to yield honey, and the 17th of July found the bees rushing out of their hives and hastening to the fields of red clover and teasles at a rapid rate. This was kept up for about 10 days, when the honey yield gradually came to an end. Acres of buckwheat were white with bloom the latter part of August, but no surplus was obtained Thus the season of 1881 was ended; for we have no Fall flowers. It is now four years since we obtained any surplus from buckwheat, so I conclude that a yield of honey from that source (in this locality) is the exception rather than the rule.

As a result of the season's operation, I have taken in comb honey 3,317 pounds, and of extracted, 718 pounds—in all, 4,035 pounds, or an average yield of 134½ pounds to the colony. I had only one really good stock in the Spring and concluded to work that for extracted honey. To give the reader a knowledge of the yield from each source, I will give the result in pounds as taken from the different sources. Willow gave 5½ pounds; apple, 19¼ pounds; white clover, 58½ pounds; basswood, 97 pounds; red clover and teasles, 232 pounds, making in all 412 pounds,

For the past nine years I have kept a correct account with the bees, and I find, by looking over the same, that the average yield from each colony has been 92 pounds each year, most of which has been box honey. The 30 colonies I had in the Spring have increased to 80 and are all in good condition for Winter. I have also raised and sent out 83 tested queens, which of course lessened the honey crop. I noticed with pleasure that each colony gave about an equal yield of honey. For years I have been breeding from those colonies that gave the best results in honey, and I am glad to see that progress has been made. When whole apiaries can be made to produce as good results as we have formerly obtained from the best stocks, we shall have no need of importing bees, as Apis Americana will be the best in the world. In addition to my own I have worked this season an apiary of 15 colonies away from home, which gave a yield of 874 pounds of box honey and 150 pounds of extracted, making a total of 2,274 pounds, or 151½ pounds per colony.

THORNS AND ROSES.

(Continued from page 818.)

CHAPTER XIV.

TRUE to his promise, Brandon came the evening after I had parted from Nevil. When I heard his voice I felt sorry that he had come, and could not help the rush of color to my cheeks, the tears filling my eyes. But neither in look, tone nor manners was there the slightest change: and if this cost him an effort, there was no visible sign of that effort; and his serene composure restored me to myself.

He stood beside aunt Dorothy, mending some broken article in her workbox, and at the same time talking to her, whilst I gazed out at the garden feeling profoundly grateful to him for not reminding me of yesterday, until he broke in on my thoughts.

"Aunt is saying, Kate, that gravity is infectious, and you have caught it from me."

"Well, my dear," said aunt Dorothy, "you have been very grave lately. I suppose Brandon wants to make you a student like himself."

"One wise Lovel is enough," he said; "and at present the wisdom of the family is concentrated in me."

"Is it really wise to bury yourself over books?" said aunt Dorothy, "until you look old and worn? But then you live like a hermit."

"My deeds upon my head, aunt Dora. Though I am a hermit, I am as free as air, and as empty."

He crossed the room, and leaned on my chair, looking down at me as he spoke.

"So Nevil has gone, Kate?"

"Yes; business of some kind called him away."

"You will have his letters to look for, and I suppose he will soon return. No news from Edith? I thought she was to come this summer?"

"She may have changed her mind—— Who's this?"

For a moment I thought it was Nevil coming for a second good-bye, but as the new-comer advanced, I recognized Edgar Dana and shivered.

"Are you cold?" said Brandon, quickly.

"Oh, it is nothing! Is he—do you——"

All too conscious of my confusion, I stopped, and Brandon for a moment gazed steadily at me, then turned to welcome Edgar, who had by this time been admitted.

He was greatly embarrassed, and as it was the first time he had met my kinsman since he had told me that story, I did not wonder; indeed, it was an unpleasant position for us both, even though Brandon were unconscious of it.

Edgar did not remain very long, seeming remarkably anxious to get away.

"Our ways are the same," said Brandon; "shall we go together, and the walk will be less lonely?"

"I—a—I go the other way," said Mr. Dana coloring. "I like walking alone—don't let me disturb you."

"Could you tell when a person disliked you, Kate?" asked Brandon, when he had gone.

"Yes; I think so. Why?"

"Nothing; only I have the same instinct."

He stayed some time with us, and when he did go he said good night kindly, and the sorrow of yesterday, and the fear of to-day, left me.

This Summer week would have been to me quite happy but for one thing—the inevitable one thing wanting in all human happiness—I had had no letter from Nevil. The mysterious silence puzzled and distressed me not a little, because he had promised to write, and he must know how anxiously I should wait for his letter. What could it mean? Was he ill? Had some accident happened? We had not parted coldly or angrily, or I might have accounted for his silence. I grew alarmed when a week had gone by; and resolved to call and ask if Mrs. Verner could give me any explanation, for he must surely be ill.

As I rode on, I tried to solve the mystery. He did not care for writing, and he might have little time for it, but he could have sent me a word, if he were not ill. Ill among strangers, and so far away! Suppose it were fever, suppose it were—— Sickened by the dreadful thought, I urged Diamond to a gallop, eager to see Mrs. Verner praying, hoping that all was well.

When I reached the house, the servant looked curiously at me, for I felt, perhaps looked, faint with terror. I hastened to Mrs. Verner, knowing that if anything were wrong her face would at once tell me. But the first glance showed me that it was serene and calm as ever.

To be Continued.

NEW PUBLICATIONS.

LIKE A GENTLEMAN. By a popular author. Boston: Lee & Shepard. Price, $1.00.

A book "written for a purpose," as the author announces, and we think for a good one. It is a temperance work of a high order, showing that champagne makes as much havoc with stomach and brain as cheap rum. The characters move in the best society and are wealthy; so the darkness of poverty makes no appearance in the story. It is well worth reading, and should be in the library of every Sunday-school.

GOLD FOIL. By J. G. HOLLAND. New York: Chas. Scribner's Sons. Price, $1.25.

This is a revised edition of one of Holland's best works. The immense circulation of the first edition is good evidence that it held a lofty place in the estimation of the reading public. The work consists of 28 essays on vital truths relating to morals and society and to the common life of man. They are replete with good counsels, and with "truths that have been verified and vitalized by human experience."

HERE COMES CHATTERBOX for Xmas, 1881! One would think that no improvements could be made in it, yet each number is still finer and fuller than the one before. In this year's we are treated to a tour around the world, and if the little folks will study each picture they will learn very much of the customs and characteristics of the people. The reading matter is of the kind that suits the young, and will do them no harm to read. Published by Estes & Lauriat, Boston, Mass.

MAGAZINES.

THE ATLANTIC MONTHLY for December contains, Chapter's 11, 12 of Dr. Breen's Practice, Origin of Crime in Society Shakespeare and Berlioz. The Portrait of a Lady; The Parting of the Ways; The Habitant of Lower Canada; British State Assassins and the Defence of Insanity; Hester Dower; Socialists in a German University; At Canterbury; Caste in American Society. Pyrrhus Ring; East of the Jordan and other books of Travel; Buddha and Early Buddhism; The Contributors Club; Books of the Month and Mark Twain's New Departure, which so far as the author is concerned is fully verified in the writing of the book. We quote, "the same public is called upon to welcome its old favorite in a new guise as the author of a tale ingenious in conception, pure and humane in purpose, artistic in method, and with barely a flaw, refined in execution." The article upon the "Defence of Insanity," will be read by the public just now, with unusual interest, also that on "Origin of Crime in Society." We thus acknowledge, Scribner's, Harper's Lippincott's, Appleton's Magazines for December. They are full of the choicest reading, and it seems to us never were better.

For Women.

CONDUCTED BY MISS RAY CLARK.

IMPROMPTU DECORATIONS AND ADORNMENTS FOR CHRISTMAS.

MRS. C. S. JONES.

LAST year owing to an unusual amount of church decorative work, we found our feet upon the very threshold of Christmas eve and no preparations made for the customary home beautifying, upon which the enjoyment of its inmates so greatly depended.

Loving hearts and ready fingers can accomplish a vast amount of this home-brightening however, and for the benefit of some other "house-wife" or "house-mother" similarly situated we will describe some of the means to which we resorted in our emergency, especially as we believe them to be novel and yet capable of imparting a vast amount of beauty and brilliancy.

There are many ways of getting up impromptu adornments from materials within reach or readily obtained, and which afford more real satisfaction than costly and studied arrangements, for inasmuch as Christmas festivities are "but for a season," it must appear to the wise and conscientious expender of household finances, that to use inexpensive yet tasteful adornments is not only sensible but a duty, as thereby we may have the more for "sending portions to those for whom nothing is prepared." Besides the usual cordons festooned round walls and windows nothing imparts such a genial feeling as a silent, but no less pronounced welcome, imparted by cheery mottoes and words of greeting, and the hall as the "entrance-chamber" to the house, should at once speak its mistress' effort as "on hospitable deeds intent," easily effected in this case by simple but striking imitations of illuminations in the genial WELCOME, or old-wold SALVE, in colors; yet bringing "The pine tree, the fir tree and the box together to beautify the place," and using evergreen frames and a large proportion of green, in varied shades, on the lettering, scrolls or other tracery. Cut large ornamental letters from card board, or taking a long, narrow strip of the same mark them out upon it; then cover with flat sprigs of evergreen or leaves, such as laurel, box or holly, making distinct lines of color with "everlastings," Autumn leaves, scarlet berries or any legitimate Christmas material. Thus each letter will stand out boldly from the ground, and from a distance will appear like some handsome illumination.

Another pretty fancy is also to thus form the name, monogram or initial of the house-mother and place it either upon a covered frame, securely fastened against the back of her table-chair and rising sufficiently to appear above her head; or against the wall behind her; in the latter case appearing in form of a plaque and made by covering a large circular piece of wood (such as the lid of a cheese-box) with putty or clay, upon which while plastic fasten mosaic designs as a grounding with suitable border, and the name MOTHER or her monogram in the center. With colors carefully arranged this can be made a striking ornament.

There is nothing more attractive in room adornment than the ever-graceful hanging-basket, which is most easily made and with inimitable beauty in this hasty adorning of the home.

Various are the discarded articles which may be "pressed into service" and perform effective work in this particular branch; pans, bowls, goblets, lamp and gas shades, bird-cages, and indeed many articles connected only with certain households may be disentombed and appropriated to this especial case.

Thus in one house, where called upon to aid in such impromptu dressing, we found several old gas-chandeliers which, when entirely covered with green, made wonderfully beautiful supports for our hanging baskets, consisting of five repaired vegetable dishes, painted green and varnished with glue, upon which, having used our supply of moss, we covered with fine shreds of shaded wool, supplied by ravelling green Brussels carpet, the lovely shades of which gave an imitation of moss so rich and vivid that all who examined it were deluded. Indeed, we know of no better imitation of velvety moss than this. The large central basket and four smaller, suspended from the arms and pendant ornaments by wire handles, passed through the China ones, when filled with white paper lilies, pink roses and buds and evergreens, with outside tracery of graceful grasses and ferns, were lovely; while above, a circle of candles fastened on tin sockets, formed it into a brilliant chandelier suspended over the table. Old bird cages, reversed and filled with shavings, likewise form baskets as pretty as they are peculiar. Moss, flowers and plumes of grasses introduced between the bars and covering the top have a charmingly airy appearance.

We cover mantels, brackets and shelves with white muslin, edged with evergreen sprays and lines of ivy, laurel or holly leaves above. The lambrequins, curtains and portieres we cover with white muslin, applying the bordering in waved lines and in some cases introducing lines of vivid scarlet braid or Autumn leaves between.

Beautiful snow-white baskets are made by boiling and scraping cattle horns, then forming card-board foundations, sewing the scrapings on in rows, each one covering the stitches of the preceding. For such impromptu occasions these are not only appropriate, but extremely lovely in appearance, especially when filled with clear pink, deep crimson or brilliant scarlet blossoms. A sprinkling of frosting adds vastly to the pretty effect.

In the dining-room the buffet or side-board is an important point, inasmuch as upon it

certain portions of the table are placed. Across the back a handsome arch should be fixed, and we would here suggest to the flower loving housewife that this arch should be an institution of the dining-room, and to secure its constant adornment that four jardinieres should be kept in constantly growing and healthy condition, changing them from time to time. In our own case we have a living arch, covered with luxuriant Cobœa Scandens, Variegated Ivy, Mausandya and Madeira vines. The rustic hanging basket, containing Tradecantia, Smilax, and in the center a Carl Holt Fuchsia. One Winter a mass of morning glories, in every color and shade, made a glorious show the entire season. In lieu of this, however, use similar means as suggested for mantels. The entire room should be made as bright, festive and joyous as possible by means of abundance of light and brilliant color.

Domestic Economy

CONDUCTED BY EMILY MAPLE.

ECHOES FROM EVERY DAY HOUSE.

ANNIE L. JACK.

SANTA CLAUS, with his wonderful pack, is just now the hope of the children, who are joyously counting the days, and looking forward without a doubt or fear. Happy, happy faith of childhood! We, on the other hand, knowing life's delusions, are constantly thinking, "What if he does not come—if anything should happen?" but they are not to be daunted by thoughts of failure.

In the meantime cooking goes on. The holidays are a busy time to every housekeeper, especially in the country when New Year's callers or unexpected guests are likely to drop in, and no confectioner is near at hand. We have, on such occasions, made a very nice cake as follows: It is

VARIETY CAKE.

One cup of butter, three cups sugar, five eggs, one cup of sweet milk, four cups of flour, one teaspoonful of soda, two of cream-of-tartar, flavored with lemon. This makes the white part, and the following mixture for the dark part gives the name to the cake—(to be put into one half of the mixture above given: One cup of raisins, two tablespoonfuls of molasses and spice to taste. This will make three good-sized cakes. Butter the cake pans, put in first the dark, and the light on top, and bake in a quick oven. It is better for children than the richer spiced cake, and pleases them just as well.

At this season of the year when there is a general slaughter among the fowls and one gets tired of the regular roast or broil, a simple and palatable dish can be prepared by boiling the fowls in as little water as possible until the bones separate from the meat. Remove all the skin, slice and mix together the light and dark parts, season with pepper and salt. Boil the liquid down a little and mix with the meat. Place in a mold, or wrap in a cloth and press with a heavy weight. When served it is cut into slices, and, as an epicure not long since remarked, is "handy to have in the house." If any of my readers have a surplus of celery I would just suggest that they cook it the same as asparagus and serve it for lunch or dinner with fowl prepared according to the above recipe, and they will enjoy the variety and flavor of this excellent vegetable in a new way.

Apple Marmalade.

Ingredients: Six pounds of peeled apples, three pounds of sugar; cinnamon or lemon, or both tied in a close taggot; half a pint of water. Time: about three-quarters of an hour. Peel, core, and slice up the apples into a preserving pan; add half a pint of water and the flavoring. Cover, and place the whole on the fire to boil until dissolved, then add the sugar, and stir the marmalade with a spoon, over a brisk fire, until reduced to a thick paste, running rather slowly off the spoon when lifted out of the pan. The marmalade must be immediately removed from the fire, and poured into pots or molds. S. R.

DOMESTIC RECIPES.

CHRISTMAS DESSERT.

Two or three days before wanting this dessert make and bake a medium sized, round sponge cake. Cut the top from the cake in one piece and lay it aside. With a spoon take out the inside of the cake leaving side walls and a bottom an inch thick. Spread the inside with jelly or jam. Make a boiled custard of a pint and a half of milk, three beaten eggs (reserve one white), a teaspoonful of corn-starch and sugar to taste. Crumb very finely the cake you have scooped out and beat it with the hot custard. When nearly cold, flavor and fill the cake with it. Spread the inside of the top of the cake with the jell or jam and fit neatly into its place. Beat the reserved white stiff, spread over the top of the cake and sprinkle thickly with powdered sugar. Set in a cool, dry place until wanted.

FROSTED ORANGES.

Six large, sweet oranges peeled and every particle of white skin removed. Take a cup of powdered sugar, divide, and stir into one part a few drops of liquid cochineal. Spread on a dish in the sun to dry and if lumpy roll to powder. Beat the whites of two eggs to a stiff froth, dip half of the lobes into the whites and then roll in the pink sugar, the other half into the egg and white sugar. Place upon a piece of white paper to dry. Arrange in a pretty glass dish and garnish with lemon leaves if you can get them.

QUESTIONS ANSWERED.

WATER-PROOF BLACKING.

L. D. Belmont, Noria Scotia would like a good recipe for making water-proof blacking for boots, shoes and harness.

ANS.—The following recipes are the best we have at hand. If any of our readers know of a better formula we shall be glad to publish it. No. 1. Melt together two ounces of mutton suet and six ounces of beeswax. Add six ounces of sugar, two ounces of soft soap, two-and-a-half ounces of lamp-black and one-half ounce indigo in fine powder. When thoroughly mixed add one-fourth pint of oil of turpentine. No 2. Melt one pound beeswax, one ounce of Prussian-blue ground in two ounces of linseed oil, one-fourth pound ivory black, three ounces oil of turpentine and one ounce of copal varnish. Mix well and form into cakes while warm.

To apply this blacking spread a very little evenly on the surface of the leather and polish by rubbing with a brush or a bit of linen cloth.

NEW-YEAR'S CAKE.

E. R., would like recipe for New Year's cakes such as are sold at professional bakers.

ANS.—A pound and a half of sugar, a pound of butter, three eggs, one half pint of cold water, one teaspoonful of soda dissolved in *warm* water, four or five tablespoonfuls of caraway seed, flour for a soft dough. Cream the butter and sugar, stir in the beaten eggs, then the flour and seed and last the soda. Roll into a sheet less than quarter of an inch in thickness, cut into diamonds, stamp and bake in a moderate oven.

NEW YEAR'S BASKET OF KISSES.

Miss A. B. wishes to know how to form a basket of macaroons or kisses for her New Year's table and what should be the filling.

ANS.—One pound (more if you wish a large basket) of macaroons or kisses, a coffeecup of white sugar, a large tablespoonful of gum arabic in the dry form, one half cup of boiling water. Put the gum into the hot water and let stand. When dissolved—every bit—stir in the sugar and boil gently until quite thick. Set into a dish of boiling water while using. Take a round, deep tin basin, butter thickly on bottom and sides. Dip the edges only of each little cake into the hot sirup, and place in close rings on the bottom of tin until it is covered. Let get perfectly dry and see that they adhere firmly to each other before you begin the lower row of the sides. Build the sides one row at a time, letting each harden before adding the next. Make loop handles with four or five macaroons or kisses stuck together. When firm, lift carefully from the tin. If for a permanent ornament for the table fill with fringed, pink tissue paper, same as motto candies are wrapped in. If to be eaten, fill with whipped cream, and if you please, dot with comfits.

New Publications.

Our Little Ones and THE NURSERY.

THE MOST BEAUTIFULLY ILLUSTRATED MAGAZINE FOR LITTLE PEOPLE IN THE WORLD. PUBLISHED IN BOSTON AND LONDON.

The NURSERY has been a Household Treasure for fifteen years. OUR LITTLE ONES has completed its first year, and is a triumphant success. The two united. All its illustrations

ANNOUNCEMENT.

YOUTH'S COMPANION

1882

THE PUBLISHERS

Have spared no effort to present an Announcement of new features for 1882, that shall represent the best ability in entertaining literature. The names of a few of the writers and a selection from the topics are given below.

Its Serial Stories.

These are by writers of rare gifts and experience. Several of the Stories will illustrate topics that are engaging public attention.

A Serial Story. Illustrated. . . . . By W. D. Howells.
A Live Story for Boys. Illustrated. . . . . By J. T. Trowbridge.
An English Story. Illustrated. . . . . By William Black.
Witchcraft at Deacon Wiggins'. . . By Mrs. Harriet Beecher Stowe.
Four Nights Among Russian Nihilists. . . By a Writer in Russia.
Tales of Old New England Taverns. . . . By Rose Terry Cooke.
Stories of Successful Business Men. . . . . By James Parton.

Its Stories of Adventure.

Incidents of Frontier Life and Adventure in the West; in Africa; in Australia; in Greenland; in China, Japan and Corea; in Russia; in New Zealand; on the Ocean. Fully illustrated.

A Pioneer School Mistress in the Far West: Her experiences—amusing, often thrilling—related to her Eastern friends. By Adeline Hall.

Lost in the Gran Chaco; or, Six Weeks in a South American Wilderness: A Six Weeks' Flight among the Cannibals. Illustrated.

Perils of a Linesman's Life: Guarding a Telegraph Wire in Sumatra. Illustrated. . . . . By Lieut. Grinnell.

On Recent Battle Fields. Illustrated. . By Archibald Forbes.

A Story of South Africa. A Serial Story. By Capt. Mayne Reid.

Very Valuable Articles.

The Ministers of the English Government during the Revolution, By E. P. Whipple.
The Beginning of Great Industries, ... By James Parton.
Life Scenes, as a Clergyman sees them, . . By Rev. Henry Ward Beecher.
Success and Failure in Life, ... By Canon F. W. Farrar.
Other Recollections of Authors, ... By the late James T. Fields.

Illustrated Travel.

China.—Incidents and facts connected with ten years of official residence in China; in which personal adventures, incidents of social intercourse with the people; and detailed views of every-day life in China will be given.
By Hon. Chester Holcombe, U. S. Legation, Pekin.

Russia.—Life in the out-of-the-way Nooks and Corners of Russia, given in a picturesque and striking series of articles. The author has been sent to Russia by the *Companion* especially for this purpose.
By Mrs. A. H. Leonowens.

Mexico.—A Naturalist's Adventures on the Mountains of Mexico, by one who is travelling in that country for Scientific Societies. By Fred A. Ober.

The Editorials, as heretofore, will be prepared by the most qualified pens, and all current topics will be treated clearly and fundamentally.

The Children's Column will be under the same popular management as for the last fifteen years, and the Prize Department will be more liberal than ever

Subscription Price, $1.75, Specimen copies sent free.

Please mention in what paper you read this advertisement.

YOUTH'S COMPANION, Boston, Mass.

SPECIAL OFFER. To any one who subscribes now, and sends us $1.75, we will send the Companion free to January 1st, 1882, and a full year's subscription from that date.

APPLETONS'
HOME BOOKS

Appletons' Home Books are a series of new Hand-volumes at low prices, devoted to all subjects pertaining to Home and the Household.

HOW TO FURNISH A HOME.
By Ella Rodman Church. Illustrated.
"Mrs. Church's directions for house-furnishing, while very artistic and cheerful, are adapted to the wants of the great army of limited incomes."

HOME DECORATION.
Instructions in, and designs for, embroidery, panel and decorative painting, wood carving, etc., with numerous illustrations.

BUILDING A HOME.
By A. F. Oakey. - Illustrated.
"Mr. Oakey discusses house-building for the purposes of people of moderate means in the Middle States, and gives plans and elevations of cottages from the very cheapest to a house to be built at a cost of $9,000.

AMENITIES OF HOME.
By M. E. W. S.
"The author has not spared good sense, right feeling, or sound principle. . . . A better book for reading in the family circle it would be hard to name."—*Literary World.*

HOME NEWS.

MONDAY, Dec. 12, 1881.

THE GUITEAU TRIAL.—Eight doctors who have made a study of mental diseases have testified as witnesses for the defence in the Guiteau trial. A hypothetical question, in which the points relating to the prisoner's mental condition as set forth by the defence, including the insanity in his family, and his alleged belief that he acted upon inspiration, were assumed to be true, was read to them, and they were asked whether upon that state of things they thought Guiteau was insane. Seven of them replied that if the propositions were true the man was insane. Dr. Worcester, of Salem, Mass., would not express an opinion, because he wanted a clearer explanation of the word inspiration than Mr. Scoville gave him. Guiteau constantly interfered in the proceedings. He began by saying that he wanted the experts to pass upon the question whether when a man claims he is impelled to do an illegal act by a power beyond him he is sane or insane. He showed a pretty clear understanding of the testimony given, and once pointed out how well it fitted his case. As usual, he was sensitive on the question of his mental powers, and was angry when a witness spoke disparagingly of his Garfield speech, declaring that he would rather be hanged as a sensible man than acquitted as a fool. He was also offended by a question implying that he was a vulgar criminal. There was nothing vulgar about this case, he exclaimed; it was all high-toned. At the end of the day's proceedings, when Mr. Scoville announced that he expected to have President Arthur as a witness, Guiteau insisted that General Grant, ex-Senators Conkling and Platt, ex-Governor Jewell, and others should be called to show what was the political situation before the assassination. Most of the witnesses for the prosecution were from Freeport, Ill., and their evidence went to prove that there was no insanity in the Guiteau family, and that the father of the assassin, instead of being a religious lunatic, was a sane and worthy citizen, much respected and trusted by his neighbors.

CONGRESS IN SESSION.—Both Houses of Congress met at noon on Monday the 5th inst. The Senate, having no officers to elect, proceeded at once to regular business. Mr. Beck introduced a bill providing for the retirement of the trade dollar from circulation, Mr. Sherman a bill providing for the issue of three per cent. bonds to replace the three and a half per cents, Mr. Logan a bill to place Gen. U. S. Grant on the retired list, and Messrs. Morrill and Garland bills providing for commission to raise the tariff. In the House the entire day was occupied in effecting an organization. Mr. Keifer, the Republican caucus nominee, was elected Speaker. The Democrats complimented Mr. Randall by giving him their votes, and the eight Greenbackers voted for Mr. Ford. The two Mahone Congressmen from Virginia voted for Keifer. On Thursday the President sent in his first message to Congress which, on all hands, is conceded to be an able document. In opening he paid an eloquent tribute to his predecessor, the late President Garfield. Secretary Folger who was recently appointed to the Treasuryship has submitted his report.

In one respect St. Louis is almost twice as great as Chicago. Her debt, funded and floating, is $22,400,000, while that of Chicago is only $12,700,000. The balance in favor of St. Louis is $9,700,000—but it is on the wrong side.

Mr. John Davis, nephew of Bancroft Davis, and son-in-law of ex-Senator Frelinghuysen, will be President Arthur's private secretary, and Mr. Davis's wife will be hostess at the White House. She is the daughter of ex-Senator Frelinghuysen.

Judge Advocate General Swaim says he has completed his review of the Cadet Whittaker court martial case and will submit the papers with his opinion thereon, to the Secretary of War this week. The report will not be made public until passed upon by the President.

A freight train of thirty-two cars, several of them loaded with live stock, was precipitated eighty feet into the Missouri River, through the giving way of a bridge.

General Judson Kilpatrick, late United States Minister to Chili, is dead. He was born near Dockertown, New Jersey, Jan. 14, 1836, and was consequently 45 years of age.

A bill has been introduced in the Senate to admit Dakota as a State.

The trial of Guiteau will be a very costly affair. The United States Marshal's fees for one day amounted to $175 for summoning talesmen alone. Beside this he has fees from all the other courts, civil or criminal. The cost of witnesses will be immense. Already the Government has twenty-five witnesses present from other cities. They receive transportation fees of five cents per mile, going and coming, besides daily attendance fees of two dollars per day. They are kept at the expense of the Government at any hotel that they select. The prisoner being a pauper, the witnesses for the defence are brought to Washington at the expense of the Government, paid and boarded. There are about thirty or forty asked for by the defence, and about thirty-five more will come. The contingent fund, as well as the other funds in the control of the court, is already expended, and Congress will soon be asked to make an appropriation to settle the bills. Of the jurors, six are Methodists, one of them a Methodist local preacher. They are all more than middle-aged, and but one has ever mixed in politics much or holds place under the Government.

Senator Saunders introduced a bill in the Senate Monday to extend the northern boundary of Nebraska to include 600,000 acres in Montana.

A terrible calamity befell the occupants of a boarding house at Gibson Station, Pa., several persons having lost their lives. The victims of the fire were exhumed and buried Sunday. The injured survivors are being cared for in the hospital, and a fund has been set on foot to aid them.

The Governor of Kansas has issued a proclamation offering rewards for the arrest and conviction of persons who may be found selling intoxicating liquor; also for the arrest and removal of sheriffs, county attorneys, city marshals and policemen who shall fail to perform the duties imposed upon them by the law to prohibit the manufacture and sale of strong drink.

It is announced that Mr. Scoville, the counsel for Guiteau, is about to deliver a lecture on the subject of the trial in Washington, and that he is driven to this course to secure means to support his family until he can resume the practice of his profession at home.

The Prohibitionists of Mississippi are again active, and will try to induce the Legislature at its coming session to submit to the vote of the people at the next election a prohibition amendment to the Constitution of the State.

Secretary Blaine has stated positively that he expects to retire from the Cabinet this week. It is intimated that the name of his successor will be sent to the Senate to-day.

The State of Iowa has nearly completed its new Capitol at a cost of $1,800,000.

A new counterfeit silver dollar has made its appearance, which is pronounced by the sub-Treasurer to be the best counterfeit silver coin ever seen. It is beautifully made and has a slight appearance of iron, which is often found in a genuine standard dollar. It is silver-plated and acid does not hurt it unless the surface is scratched up. The weight is the marvelous point in the deception. The counterfeit, as it stands, would pass in size easily, and its weight would not be detected on any but a fine scale. The date upon the coin is 1878.

The town of Augusta, Ark., on White River, was destroyed by fire recently. Only three buildings were left standing. The scenes in the streets were reported as being terrible. Several persons were fatally burned and injured by falling walls. Loss $300,000.

The commissioners appointed to inquire in to the feasibility of an underground railway on Broadway, New York, report that the cost would be $2,000,000 a mile, and the damage to property much greater.

Restoration of Appetite.

A Physician writes in regard to one of his patients: "The effect of Compound Oxygen was to give him an appetite. Within three days from his first inhalation he was obliged to get his dinner two hours before the usual time." Treatise on Compound Oxygen, *sent free*. Drs. STARKEY & PALEN 1109 and 1111 Girard Street, Philadelphia, Pa.—*Adv.*

AGRICULTURAL NEWS.

MONDAY, DEC. 12, 1881.

Here are some items of agricultural news condensed from telegrams received here between Friday noon Dec. 9, and noon to-day: Portland, Me: Weather still mild. Country collections are excellent, showing farmers are in easy circumstances. Lumbering active; and all artisans are fully employed affording good markets for produce.....Boston, Mass: Provision trade good: demand for export increasing; prices tolerably firm. Flour stiffer on account of advance in wheat at the West; a further improvement in the market is looked for. Steady demand for most kinds of wool, and no change in prices—sales of the week 2,250,000 pounds of all kinds including X and XX Ohio and Penn., fleeces at 42½@44c. with 50,000 choice at 45c. Michigan and Wisconsin fleeces 41@42c for X. Medium and No. 1, 55@48c. Fine unwashed 25@33c; medium grades 25@35c. and choice medium 30@35c. Combining and Delaine quiet with sales at 46@49c. for fine delaine. Large business in pulled wools, sales of 35,000 pounds at 33½@51c. largely at 40@43½c.....Philadelphia, Pa: Cotton has declined 1-16 since Wednesday: wool dull, a weakening in prices reported in some grades. Feed stiffer: Winter $21@21.50 against $20 last week. Spring wheat bran goes from $18 last week to $19@20 now. Prices of wheat about 1c. per bushel higher. Rye dull. Corn firm and in good demand. Provisions steady at last week's rates. Apples, chiefly inferior lots, freely offered; choice lots high. Home supply of potatoes light; but heavy shipments from Canada have a tendency to lower prices.....Cleveland, Ohio.—Grain has ruled firm for several days, No, 2 red winter wheat is selling at $1.37. Provision market a trifle weak; mess pork $17.50. Live hogs active at $6.20 for medium. Collections good.....Cincinnati Ohio,—Little or no change in farm products. Grain, provisions, flour and hogs remain about the same. Cotton trade for the year the best in the history of this city; receipts have aggregated 325,371 bales, against 312,319 bales for the previous year. Ordinary cotton has averaged 7.59c during the year, against 9.64c last year; good ordinary 8.99c, against 10.56c; low middling 10.75c, against 11.27c; middling 10.97c, against 11.68c; good middling 11.50c, against 12.06c; middling fair 12.81c. against 12.66c; fair 12.94, against 13.62c. The Price Current from 88 per cent. of the pork-packing points estimates there is a shortage of 1,000,000 hogs in the hog crop this year—the popular estimate put the shortage at 1,725,000 hogs. Compared with a year ago live hogs here are worth about $1.60 per 100 pounds higher or 35 per cent.; mess pork is $4.15 higher, or 31 per cent.; lard 2¾c per pound higher, or 32½ per cent.; sides, 2.20c per pound higher, or 33 per cent. At such an advance the supply is expected to be ample.....Louisville, Ky.—Pork packing will be closed (?) to-morrow (Saturday) with about 100,000 hogs less than last year, and prices from $1.75 to $2 per 100 pounds higher. Receipts of leaf tobacco increasing. New crop burleys bringing extravagant prices. Cotton receipts liberal; demand brisk; but offerings scant, as holders want better figures.....Chicago, Ill.—Considerable improvement in hog trade; receipts for week foot up about 90,000 more than for the corresponding week last year. Quality now about the same as then. Fair speculative trade in grain with unusual excitement.....Peoria, Ill.: Grain trade good; receipts and shipments average better than last week. Prices for farms and real estate generally are better than at this time last year.....Evansville, Ind.: Pork packing has begun and hogs are coming in quite freely. Buyers are paying 5½@6c gross and 7½@8c. net.....Detroit, Mich.: Weather more settled and the interior movement good. Considerable calls for money to handle pork products. Prices for all staple goods are firm in spite of the prospect of a mild Winter. Lumber and other building materials are firm, with contractors still pushing work. Navigation is practically closed; the season's shipments of wheat have aggregated 1,990,000 bushels. Farmers not selling wheat freely; interior mills are buying here. The average price of salt in the Saginaw market this year has been 95c.; the lowest previously were 75c. and 85c .....

Milwaukee, Wis.: Prices of grain and provisions have declined considerably. A perceptible increase in wheat receipts and some of the local mills are again grinding.....Minneapolis, Minn.: A week of fine weather: good country roads and free deliveries of country produce, except wheat, which is held back for higher prices. The loss of the flouring mills by fire will not materially affect the wheat or flour markets, as the capacity left is enough to grind all the available good wheat. The mills will be rebuilt. Less than 10 per cent. of the total capacity was destroyed. Flour stronger. Full returns of cut lumber of mills for the season, show 235,000,000 feet; stock in yards, 82,000,000 feet. Collections satisfactory.....St. Louis, Mo.: Provisions for cash and immediate delivery are higher and hard to obtain. Grain unsettled and higher for future delivery. Flour and meal unchanged. As to live stock, local buyers have offered to sell at a sacrifice.....Kansas City, Mo.: Local wheat market weak and lower. Corn, ditto. Cattle market dull; prices unchanged. Hog receipts for week ending Tuesday 30,766; market quiet with a downward tendency. Prices range from $5.30@6.10. .....

Omaha, Neb.: Open Winter yet. Collections much better. Prices of produce and poultry have dropped since Thanksgiving, and no shipments of the latter are being received owing to very low prices. Corn has fallen off a few cents, but sells at 45@50c., and farmers are generally taking advantage of good weather and prices to market their crops. The probability of a mild Winter tends to lower the price of corn, as not so much of it will be needed for feed.....San Francisco, Cal.: Wheat weak with a falling market. Orders for the delivery of wheat overland at New Orleans have been received, and if this first shipment turns out a success much grain and other produce will seek a foreign market by that route.....Baltimore, Md.: Cotton trade grown enormously. Storage facilities crowded: a new press constantly employed. Inactivity in the grain market has restricted exports. Southern wheat 1@2c. lower and demand moderate. Western wheat slow but steady; prices unchanged. Southern corn active; prices steady; arrivals liberal. Western corn firm, with a slight advance in prices. Owners of vessels are firm as regards freight rates, in the belief of the early resumption of grain shipments. Receipts of potatoes very light; good sorts bring $1.10@1·20 per bushel, Canned goods firm.....Norfolk, Va.: Cotton receipts large; market firm but quiet. Peanuts coming in freely; prices rule low; quality ordinary. Collections fair; weather good.....Wilmington, N. C.: Weather cooler with occasional rains. Receipts of cotton have increased 2,000 bales. Rice and grain firmer. Provisions quiet but steady. Lumber wanted at an advance.....Savannah, Ga.: Merchants seem uneasy at reports from the country and do not like to risk selling goods there. Cotton is not overbrisk, but factors are cheerful, selling on a basis of 11¼c. for middling. Rice market dull; demand light .....Augusta, Ga.: Farmers and store-keepers are holding back their cotton expecting an advance in price, selling only enough to raise money to pay pressing debts. They are buying only such goods as they are obliged to have. Jobbers are making greater efforts to collect than to sell.....New Orleans, La.: Cotton in demand and steady. The latest estimates of the total cotton crop vary from 5,014,170 to 5,700,000 bales. Receipts of sugar and molasses small; demand moderate. Rice quiet.....Memphis, Tenn.: Cotton receipts heavy so far this month and prices satisfactory to producers. Provision and produce markets well supplied; demand moderate. Collections fair.....Nashville, Tenn.: No change in quotations of grain and flour. General produce market steady. Eggs quite active at 29@30c. Collections good.

A Maryland exchange refers to Mr. Thos. G. Forward, of Blair, that State, who was cured by St. Jacob's Oil of rheumatism.—Rochester, (N. Y.) Sunday Morning Tribune. *Adv.*

Lydia E. Pinkham's Vegetable Compound will at all times, and under all circumstances, act in harmony with the laws that govern the system. Address Mrs. Lydia E. Pinkham, 233 Western Avenue, Lynn, Mass., for circular.—*Adv.*

The Youth's Companion,

of Boston, is a sprightly, entertaining paper, deservedly popular, and is, without exception, the best of its kind published in America. It is filled to overflowing with the choicest original matter, of so diversified a character that it never fails to interest, instruct and amuse, and is welcomed in the household by young and old alike.—*Adv.*

Don't Get the Chills.

If you are subject to Ague you must be sure to keep your liver, bowels and kidneys in good free condition. When so, you will be safe from all attacks. The remedy to use is Kidney-Wort, either in dry or liquid form.—*Adv.*

A Fine Hair Dressing.

COCOAINE dresses the hair perfectly, and is also a preparation unequalled for the eradication of dandruff.

THE superiority of BURNETT'S FLAVORING EXTRACTS consists in their purity and great strength.—*Adv.*

The Markets.

CHICAGO.—WHEAT unsettled but generally lower, closing firm; No. 2 Chicago Spring, $1.28@1.28⅛ cash; $1.28, December; $1.29@1.29⅛, January; 1.30⅛, February; No. 3 do. at $1.15½@1.15¾; rejected, 85@90c.; sales No. 2 Chicago Spring at $1.28@1.29⅛, January. CORN unsettled, closing firm at 60⅞@61¼c., cash and December; 61⅛@61¼c., January; 61¾@61⅞c., February; 66½@66⅝c., May; sales at 66@66¾c., May; rejected, 59½c. OATS strong and higher, especially for cash, at 46¾c., cash; 46⅞c., December; 45½c., January; 44¼@44⅝c., Feb. BARLEY easy at $1.06. FLAX-SEED dull at $1.35@1.37. DRESSED HOGS firm at $6.80@7.05. PORK in fair demand but lower, at $17, cash and December; $17.10@17.12½, January; $17.32½@17.35, February; $17.55 March. Lard in fair demand but lower at $11.05, cash; $11 22½, December; $11.23½, January; $11.37½@11.40, February; $11.50@$11.52½, March. Bulk-meats in fair demand but lower; shoulders, $6.50; short rib, $8.95;

short clear $9.25. HOGS—market active and prices 5c. higher than yesterday; common to good mixed, $5.60@6.10; light; $5.75@6.00; heavy packing and shipping, $6.20@6.40; Philadelphias and lard hogs, $6.45@6.55; skips and culls, $4@5.25. CATTLE—market fairly active; fat cattle 10c. stronger than yesterday; Christmas beeves, $7.25@7.65; exports, $6.20@$7; good to choice shipping, $5.40@6; poor to to fair, $4@5; mixed butchers' firm; poor to medium, $2@3; good to choice, 3.20@4; thin Texas cows and mixed lots, $2.75@3.50; Wyoming natives, $4.65@5; stockers and feeders steady, with a fair demand, at $2.60@4. SHEEP—market firm, on best a little stronger; inferior to fair, $2@3.25; medium to good, $3.60@4; choice, $4.50@5.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Dec. 10, 1881.

BEANS AND PEAS.—There is more activity and all white have a better tone, including foreign. The latter range at $1.90@1.95 when fine. Red kidney dull but held with more confidence. Turtle soup beans are merely nominal. Green peas are quiet and unchanged. Southern B. E. peas are in fair request.

Beans, marrow, prime, $3.50; fair to good, $3.25@3.40; medium, choice, $3.30; fair to good, $2.90@3.10; pea, choice, $3.25@3.30; fair to good, $2.90@3.00; white kidney, choice, $3.40@3.45; good, $3.30@3.30; red kidney, choice, $2.85@2.95; fair to good, $2.50@2.75; turtle soup, $1.75@1.80.

Peas, green, prime, in bbls., $1.65@1.70; green, fair to good, $1.40@1.60; Southern b. e., per 2-bu. bag., $3.45@3.50.

Receipts of beans for the week, 6,770 bush.
Exports do. 488 bbls.

BUTTER.—Free supplies of the finer grades have taken off the strong feeling that prevailed last week. Last prices for creamery held up to Tuesday; since then the tone has been weak, and if dealers would speak candidly it would be found that all desirable grades have to be shaded to make business. Western imitation creamery is showing an excellence of quality that suits some of the best buyers. The weather is cold and useful cheap grades are expected to move faster.

Creamery, choice, 40c.; good to prime, 37@39c.; fair to good, 32@37c.; poor, 20@25c.; sweet cream, fresh, 34@35c.; State dairy, half tubs and pails, choice, fresh, 34@35c.; good to prime, 32@33c.; fair to good, 28@32c.; Welsh tubs, choice, fresh, 33@34c.; good to prime, 31@32c.; fair to good, 27@31c.; poor to fair, 25@25c.; State dairies, firkins and tubs, choice, 32c.; good to prime, 29@30c.; fair to good, 27@29c.; firkins, dairies, choice, 31c.; good to prime, 28@30c.; fair to good, 24@28c.; poor to fair, 18@24c.; Western imitation creamery, 30@36c.; dairy, fresh, choice, 31@33c.; good to prime, 25@28c.; fair to good, 20@25c.; factory, late made, choice, 25@28c.; late made, good, 16@18c.; fair, 14@15c.; Iowa, fine June, 16½@17c.; Ohio and Ind., June, 15½@16½c.; June, fair to good, 15@15½c.; factory, very poor, 13@14c.; roll butter, good to prime, 20@22c.; fair to good, 20@22c.

Receipts for the week, 29,582 pkgs.
Exports do. 390 do.

CHEESE.—Shippers have brought high grades of factory sparingly and there is no quotable change in prices. Some choice Ohio are in stock held close to best State. Good skims are in demand for home use as prices are attractively low.

State f't'y, fine, Sept. 12¼@12½c.; good to prime, 10½@11¾c.; fair to good, 9½@10½c.; poor to fair, 8@9c.; Ohio factory, flat, fine mild, 11¾@12¼c.; good to prime, 10@11c.; fair to good, 8@10c.; poor to fair, 6½@8c.; creamery, partly skimmed, choice, 8@9c.; partly skimmed, for export 6@7½c.; full skimmed 3@4c.

Receipts for the week, 69,662 bxs.
Exports do. 30,750 do.
Liverpool cable 128. 6d.@15s.
Steam to Liverpool, 5s. 6d@6s. for Summer to late makes.

COTTON.—Port arrivals have run unexpectedly heavy and prices have bent under them. Easy figures have led to the sale of some full lines of spot for export, but home spinners have purchased moderately and may not appear importantly until after Jan. 1

CURRENT PRICES FOR SPOT COTTON.

Quotations based on American standard of classification and on cotton in store, running in quality not more than half a grade above or below the grade quoted.

	Uplands.	N. Orleans and Gulf.	Texas.
Ordinary	9¼	9 9-16	9 9-16

STAINED.

Good ordinary	8 13-16	Low Middling	10½
Strict good ordinary	9 13-16	Middling	11⅛

Average of yesterday's forward deliveries as officially reported on the bulletin, were as follows:

December, 11.85c.; January, 12.07c.; February, 12.27c.; March, 12.46c.; April, 12.61c.; May, 12.74c.; June, 12.86c.; July, 12.99c.; August, 13.05c.; September, 12.38c.; October, 11.72c.

Receipts for the week, 46,378 bales.
Exports do. 8,912 do.

EGGS.—Receipts for the week, 6,041 bbls.; do. last week, 7,008 do. Prices are something in buyers' favor, but all good, reliable, fresh marks are quoted with strong tone. Most of the supply has been held. Limed not moving so freely, but holders feel safe.

New J'y L. I. and near river, single bbls., per doz., 34@35c.; Pa. and State, fresh laid, 30@31c.; do., fair to good, 28c.; Western, fresh laid, 29@30c.; do. and Canadian held, prime, 26c.; inferior, 24@25c.; southern, fresh laid, 29@30c.; limed, State, 23½@24c.; Canadian and western, prime, 23@23½c.; fair to good, 21½@22½c.

FLOUR.—Low grades and No. 2 have been wanted daily, especially for provincial use, and prices have held up well. High and family brands have been largely included in the receipts and prices close easy. Buckwheat flour is in larger supply, and the market is dull at the easier prices. Corn meal steady.

No. 2, per bbl., $3.90@4.50; State and Western, superfine, $4.50@5.10; city mills, XX, $6.50@7.35; Spring wheat, extra, $5.15@5.50; Spring XX and XXX, $5.65@6.75; patents, $6.50@8.50; Ohio round hoop shipping, $5.35@5.75; trade brands, $5.85@6.50; St. Louis extra, $5.40@5.90; do. double extra, $6.10@6.50; do. family, $6.65@7.00; Southern extra shipping, $6.00@6.40; do. XX and family, $6.50@7.50. Rye flour, superfine, $4.85@5.20; buckwheat flour ₱ 100 lbs. $3.75@4.00. Cornmeal, Brandywine, ₱ bbl. $3.75@4.00; do. Western, $3.35@3.75. Wheat feed, 40 lb ₱ ton, $19.50@20.00; 60 lb ₱ ton, $20.00; 100 lb ₱ ton, $21.00@23.00; rye feed, $22.00@23.00.

Receipts of flour for the week, 42,958 bbls.; cornmeal, 3,750 do.

Exports of flour for the week, 42,960 bbls.; corn-meal 4,200 do.

FRESH FRUITS.—The mild weather has been severe upon stored lots and many have been repacked at this early date. A good many have gone abroad, though the market across the water has not a favorable tone. It is expected, however, that the holidays will enliven the trade, and some very choice marks have gone out. Exports from New York for the week, 5,300 bbls.; from Boston, 6,000 do.; from 1,500 do. Pears and grapes are hardly asked for. Florida oranges are not running in regular good quality yet. A few fancies make $4.50 per half bbl. box. Cranberries firm at a new advance.

Apples, Spitzenburg, ₱ bbl. $3.50@4; Greening, fancy, $3.50@3.75; Baldwin, do. $3.50; Baldwin, Greening and Spitzenburg, fair to prime, $3@3.25; Seeks, prime, $3.00@3.50; northern spy, prime, $2.75@3.00; russet, prime, $2.75@3.00 mixed lots, State, prime, ₱ bbl., $2.75@3.25; do. fair to good, $2.25@2.75; seconds, $1.75@2.00. Pears, Boston, lush. boxes, poor to good, $1.50@3.50; Vicar of Wakefield ₱ bbl., $2.50@3.00; Grapes, Catawba State, case of 18 3-lb. bxs. 3.00@4.00; baskets, ₱ lb., 6@8c.; Isabella, State baskets, 3@3½c. Florida oranges, half-bbl. boxes, choice, $4.00; good to prime, $3.00@3.50; inferior, $2.00@2.50; thirds, choice, $2.75; fair to prime, $2.25@2.50; inferior, $1.50@1.75. Cranberries, Cape Cod, fancy, large, ₱ bbl. $11.00@12.00; good to choice, $9.50@10.00; poor to fair $6.00@8.00; ₱ crate, $3.25@3.75; New Jersey fancy, $3.25@3.50; fair to prime, $2.75@3.25; poor to fair, $2.25@2.75; frosted, 50c.@$1.

NUTS.—Peanuts are firm and in fair demand. Pecans steady. Hickory nuts dull and little more than nominal. Black walnuts quiet.

Peanuts, Va., hand-picked, ₱ lb, 6¾@7c.; fancy, 6¼@6¾c.; extra prime, 6@6¼c.; good to prime, 5½@6c. shelled, 5@6c.; pecan nuts, 10½@11¼c.; hickory, shellbark, State, ₱ bu. $1.00@1.12; Western, $1.00; bull nuts, 40@50c.; black walnuts, 50c.

GRAIN.—The interior movement in wheat is light and with an enlarged export call prices are ruling strong and better. Corn has been rather neglected by exporters and prices have weakened under liberal supplies. Oats have wavered some, but close steady with the filling of contracts and the increased local demand of Winter.

Wheat, Spring, $1.25@1.39; Spring No. 2, $1.32@1.37; red Winter No. 2, $1.42½@1.41; red Winter, $1.35@1.45; white Western and State, $1.35@1.45. Rye, 96c.@$1.00. Oats, white No. 1, 54@54½c.; No. 2, 52@52½c.; No. 3, 51c.; mixed, No. 1, 51½@52c.; No. 2, 51@51½c.; No. 3, 48@50c. Corn, Western, mixed, 69@69½c.; do. No. 2, 71½@72c. yellow, 70@73c.; white, 72@75c. Barley, Canada, No. 1, $1.10@1.12; do. "bright," $1.13@1.15; State, 4-rowed, 93c.@$1; 2-rowed, 88c. Buckwheat, $1@1.05.

Receipts for the week, wheat, 909,350 busn.; corn, 263,567 do.; oats, 125,950 do.; rye, 70,492 do.; malt, 52,400 do.; barley, 112,950 do.

Exports for the week, wheat, 395,707 bush. corn, 263,299 do.; oats, 1,775 do.

The visible supply of grain, comprising the stocks in granary at the principal points of accumulation at lake and Atlantic ports, and on rail, on lakes, on canal and on Mississippi River:

	1881. Dec. 3. bush.	1880. Dec. 4. bush.	1879. Dec. 6. bush.
Wheat	18,876,127	26,930,859	27,850,685
Corn	18,817,521	15,753,676	10,337,866
Oats	2,820,015	3,587,563	2,798,930
Barley	3,165,974	2,861,443	4,673,970
Rye	1,253,216	913,014	1,191,683
Total	44,932,883	50,046,595	46,860,634

HAY AND STRAW.—Receipts of hay are unusually heavy. The railroads are running to their best capacity, and the accumulations have reduced prices while the tendency is to still lower figures.

Prime Timothy hay, ₱ 100 lbs., 95c.@$1.00; medium Timothy, 75@85c.; shipping grades, 60@65c.; clover mixed, 70@75c.; all, 60@65c.; Straw, best 70@75c.; short 55@60c. oat and wheat straw, 40@45c.

Exports for week 1,876 bales.

HONEY.—Quiet; prices would have to be shaded before a large business would ensue.

White clover, fancy, 1-lb bxs, ₱ lb, 19@20c.; do. 2-lb bxs, 18c.; good to choice, 1@2-lb bxs, 15@17c.; buckwheat, 1-lb bxs, 14@15c.; 2-lb bxs, 12@14c.

HOPS.—The Producers' Price Current says: "Brewers' wants are light and they bid very low prices. Small lots steadily arrive."

Crop of 1881, choice, 26@27c.; good to prime, 23@25c.; fair to good, 18@23c.; eastern, 16@20c.; 1880, good to prime, 17@20c.; poor to fair, 10@15c.; 1879, fair to prime 7@15c.

Receipts for the week, 1,776 bales,
Exports for the week, 399 do.

MILK.—The market for surplus or commission cans has again done well. The opening was $2.50 and the close $3.50; average about $2.45 per can of 40 quarts. Many farmers are receiving 3½c. per quart.

POULTRY AND GAME.—Bad weather and excessive supplies have caused a rough market for dressed poultry and it will take some days for the market to recover. Stale lots are selling very low.

Turkeys, Phila. pr, 12@14c.; J'y pr. 12@13c; State and W'n pr, 10@11c.; poor to good, 4@8c. Chickens, Phila. prime, 12@14c.; Bucks Co. do. 12@13c.; Jersey, do. 11½@12½c.; State and Western, do. 9@10c. Fowls, Phila. prime, 10@11c.; Bucks Co. 9@10c.; New Jersey, do. 9@10c.; State and Western, do. 8@9c.; poor to good, 4@6c.; inferior, 8@10c. Ducks, Phila. prime, ₱ lb, 12@13½c.; Jersey and Bucks Co. 12@13c.; State and Western, 10@12c; poor to good, 5@8c. Geese, Phila. dry-picked, pr, 11¼@12½c.; Jersey and Bucks Co. 10@12c.; State and West'n, 9@10c.; fair to good, 8@9c. Squabs, white, ₱ doz. $2.00@2.25; dark, $1.25@1.50.

Cheap dressed has made a low, dull market for live worse than before. Ducks in a small way are an exception.

Chickens and fowls, J'y, State and Penn. ₱ lb 8@9c.; Western and Southern, 7@8c. Fowls, New Jersey and State, 9@10c.; W'n, 8@9c.; Roosters, old, 4@5c.; Turkeys, Jersey and Penn. 9@10c.; Western, 8@10c. Ducks, Jersey, extra-large, ₱ pair, $1@1.25; Jersey, New York and Penn. 75@87c.; Western and Southern, 55@65c. Geese, Jersey, $2@2.25; N. Y. and Penn. $1.75@2; Western mixed, $1@1.50. Pigeons, 20@25c.

Game is moving well at very satisfactory prices. Quail have advanced for large choice birds. Venison sells well as restaurants begin to name it regularly. Rabbits scarce and high. It is an objection to send them drawn.

Canvasback duck, Havre de Grace $2.75@3; and $2.25@2.50 for Norfolk; no Western arriving; redhead are out of the market, the last Western sold at 75c. Mallards are plenty; south-western are not generally selling above 30c, but prime Western sell at 40c, and rarely up to 50c. for very choice. Blue-winged teal are quoted at 30@50c. and green winged at 30@35c.

Quail, choice, ₱ doz. $2.00@2.25; inferior, $1.25@1.75; grouse, choice, ₱ pair $1.00; drawn, 60@75c.; partridges, State and W'n, prime, $1.; Eastern & Minn 75@87c.; soft, 65@75c.; woodcock, choice, 75c.@$1; hares, 35@40c.; rabbits, 30@40c.; venison, Minn. short saddles, ₱ lb. 15@16c.; State & Wn. 13@14c.; whole deer, 10@11c.

PROVISIONS.—English and Scotch buyers have operated to a good extent, but the market is not in the good form shown when it was thought that France had removed obstructions to commerce. The decision of several weeks ago, if it was a decision, has been indefinitely revoked, and Continental trade at the moment is unsettled. The bulk of the trade has been in lard and bacon, and the belief in a shortened hog crop may possibly lead to some speculative holding; at the moment, however, there are numerous free sellers. Beef and beef hams very firm.

Pork, West. mess, old, ₱ bbl. $17.25@17.50, do. new, $18@18.25; prime mess, $16.50@17; extra prime, $13.75@14. Lard, steam Western, ₱ 100 lbs, $11.25@11.30; prime city, $11.20. Hams, smoked city, ₱ lb. 12½@13c; pickled Western and city 9¾@10¾c. Shoulders, smoked city, 8¼@8½c; pickled, 7¼@7¾c. Rib bellies, pickled, 9½@9¾c. Bacon, long clear Western, 9¾@9¾c. Beef, Western mess, ₱ bbl. $12; packet, $14.50@15.00; India mess, ₱ tce. $25@27. Beef hams, ₱ bbl., $21@22.

Receipts for the week—Beef, bbls. and tcs. 1,621; pork, bbls 8,911; cut-meats pkgs 36,850; lard, do. 27,410.

Exports for the week—Beef, bbls. and tcs. 2 917; pork bbls. 4,025; cut-meats, lbs. 6,852,638; lard do. 1,899,141.

RICE.—The market shows firmness and is fairly active. We quote:—

Carolina and Louisiana, common to fair, 5½@6c.; good to prime, 6½@7c.; and choice, 7¼@7¾c.; Rangoon at 5¾@5¾c., duty paid, and 2⅝@2¾c., bond; Patna at 6¾@6½c.

SALT.—Quotations are:—

Ashton's, $2.50; Higgins's, $2.50; Phœnix superfine sifted dairy, $2.50; Holmes's extra sifted, $2.50 ₱ sack and 65c. ₱ quarter sack; Deakin's, $1.10@1.50; Washington's, $1.40; Marshall's, $1.40; Virden's, $1.40; Worthington's, $1.40; Turk's Island, 25@30c.; Mediterranean, 25@28c.

SEEDS.—Clover is dull. The lots arriving have chiefly been bought to arrive. Export business very dull. Timothy offered from store at easier prices; a car lot on track of seed below prime, off color sold at $3.50. Rough flaxseed decidedly lower; offered at $1.10 in Chicago and $1.55 here.

Clover, Western, 1881, car lots on track, 8¼@9c.; Timothy, job lots in store, $2.60@3.10; car lots, on track, $2.10@2.70; Flaxseed, American, rough, ₱ bu. $1.50@1.55.

SUGAR.—We quote as follows:

Cut loaf, per lb, 9⅜@9⅝c.; crushed, 9⅜@9⅝c.; powdered, 9⅛@9¾c.; granulated, 9¼c.; mould "A," 9¼@9⅜c.; confectioners' "A," 9@9⅛c.; standard "A," 8⅞@9c.; off "A," 8¼@8⅞c.; white extra "C," 8⅛@8⅜c.; yellow extra "C," 7⅝@8c.; "C," 7¼@7½c.; yellows, 6⅜@7¼c.

TOBACCO.—There is no export interest. Sales are mainly for home manufacture and run upon leaf stock.

VEGETABLES.—Exports of potatoes for week 7,800 bbls. The market is hardening again, as receipts are light and the demand is fairly active.

Potatoes—Early Rose, N. S., ₱ d.-h. bbl., $3@3.25; State, ₱ bbl $2.87@3.12 bulk $2.75@3.00; Prolific, N. S. per d.-h. $2.75; bulk ₱ bbl. $2.50@2.75; Snowflake, State, ₱ d.-h. bbl. $2.75@3.00; bulk, ₱ bbl. $2.62@2.87; ₱ d.-h. bbl. $3@3.12; bulk, ₱ bbl. $2.87@3.00; Burbank, d.-h $3@3.12; bulk, ₱ bbl. $2.87@3.00; Peachblow, ₱ d.-h. bbl., $2.75@3.00; Peerless, bulk, ₱ bbl., $2.50@2.62; Mercer P. E. Island ₱ bbl. $1.50@2.00; sweet potatoes, Va. yellow, ₱ bbl. $3.75@4; Del. River, pr. $4.50@4.75; Jersey, ₱ bbl. $3.50@4.00; inferior, $2.50@3.25.

Onions have declined; cabbages unprecedentedly high. A dealer remarked: "There's not enough for cold slaw." Squash firm.

Onions, white bulk, ₱ bbl. $2.50@3.50; yellow, $2.00; red, east, $2.00; red Chester, $1.75@2.00; squash, ₱ bbl., $2@3.50; cabbage, ₱ 100, $10@20; beets, L. I. ₱ bbl. $3.25; carrots, $1@1.25; turnips, Russia, L. I. $1.75@2; do. Canada, $1.50@1.62; cauliflower, fancy, $5@7; average quality, $1.75@2.50; inferior, 50c@$1; celery, ₱ doz., $1.50@2.00.

WOOL.—Business is quiet, but prices are nominally strong. Holders express themselves assured that there will be no pressure of stock and that business will open with a good support to as full if not better quotations than are now current. This may not strictly apply to low grade wool, as a long neglect may induce concessions. A good point of reliance for holders is the fact that foreign markets are high, and there is not much danger of competing importations.

LIVE STOCK MARKETS.

NEW YORK, Saturday, Dec. 10, 1881.

BEEVES.—Receipts for the week, 12,095 head; do. last week, 12,460 do. The closing tone of the market was better than on any previous day this week. Colder weather has improved the demand for dressed beef, and slaughterers were willing to make extra purchases to day, presuming that prices are likely to be higher on Monday. The offerings were not excessively large, yet ample for all requirements. Prices were generally rated about the same as at the opening on Wednesday and from $1 ₱ head to ¼c. ₱ lb higher than the finish on Wednesday; but the close was rather dull and late sales were not up to the early ones. Five cars of light Cherokee cattle sold at 7½c. to dress 55 lbs.; 5 cars of Texans at about 7½c. to dress 55 lb; several loads of Colorados at 7¾@8¼c. to dress 55@56 lb; common to fair natives at 7¾@8¼c. to dress 55@56 lb; good to really prime do at 8¾@11¾c. to dress 56@57 lb, and a few head of choice at 12c. to dress 57 lb.

VEAL CALVES.—Annexed prices for live calves have only been current for a few days. Choice Mt. Hollys very firm.

Hog-dressed, choice, 12¼@12c.; dressed, fair to good, 10@12c; do., grass, 4½@5½c; live calves, N. J. prime to choice, 9c.; do. State, 8¾@9c.; fair to good, 8@8¾c.; poor to fair, 6@8c.; Mount Hollys, 160 to 220 lbs 9@10c.; 220 to 280 lbs 8@9c.; 280 to 400 lbs 6@8c.; live calves, fed, 4@4½c; grass, 2¾@3½c

MILCH COWS.—The market for most of the offering has ruled easier, and many lots have gone to Long Island dairymen. State cows have sold at $40@55 ₱ head; a few singles $70.00@75.00.

SHEEP AND LAMBS.—Receipts for the week, 28,285 head; do. last week, 45,330 do. The market had a firmer tone, but slaughterers had no urgent wants. The small business was at slightly advanced prices for good stock, but there is scarcely any improvement in common stock lots. Sales of sheep were at 3@5c. for poor to very good; several car loads of light Michigan sheep and lambs mixed sold at 4@4½c., and a few State and Canada lambs at 6@6.70. A real choice lot of lambs, would have brought 6¾c.

SWINE.—Receipts for the week, 36,300 head; do. last week, 31 467 do. High hogs at the West give our market a firm tone.

Hogs, New Jersey dressed, light, 8½@8¾c.; medium, 7¾@8c.; heavy, 7½@7¾c.; city dressed, 7¾@7¾c.; pigs, 8c.; live hogs, corn-fed, ₱ 100 lbs, $6.00@6.25; pork tenderloins, ₱ lb, boxed, 7@10c.

Terms for 1881.

A Bargain!
THE
OHIO FARMER
AND THE
RURAL NEW-YORKER.
BOTH PAPERS ONE YEAR
FOR ONLY THREE DOLLARS!

THE OHIO FARMER, published at Cleveland, Ohio, is one of the oldest and very best Agricultural and Family Journals of America. It has been established thirty-five years, is a 16-page, 64-column weekly, with frequent 16-column supplements, giving to its readers nearly 900 columns of the most valuable, reliable, interesting and instructive matter in a year, at only
$1.50 PER YEAR, POSTAGE PAID.
THE OHIO FARMER is a thoroughly practical Agricultural Journal, containing each issue about one hundred articles written expressly for it by actual, practical, successful Farmers, Horticulturists, Thoroughbred Stock Breeders, etc. It aims to give actual instruction from reliable sources, that any farmer can understand and put into practice. It is
Acknowledged Authority on all Agricultural Topics,
and is conducted by an able and experienced Editorial Management, who spare no expense or labor to add everything possible to its value.
THE OHIO FARMER has now a paid list of **over 35,000** subscribers, which is unquestionable evidence of its value to the intelligent farmers of the country.
THE RURAL NEW YORKER, with Free Seed Distribution, and THE OHIO FARMER will both be sent one year for **only $3.00**, which is only about the price either one ought to be offered at. This is a bargain to any farmer who wants the BEST agricultural papers of this country.
For Specimen Copies and Premium Lists of THE OHIO FARMER, free, address
THE OHIO FARMER, Cleveland, Ohio.

It is manifest that from GOOD SEEDS ONLY can Good Vegetables be obtained.
The character of LANDRETHS' SEEDS has been substantiated *beyond all question.*
They are the STANDARD for Quality.
Over 1500 acres in Garden Seed Crops under our own cultivation.
Ask your Storekeeper for them *in original sealed packages,* or drop us a postal card for prices and Catalogue.
Wholesale trade prices to dealers on application.
Founded 1784. **DAVID LANDRETH & SONS,** 21 and 23 S. Sixth St., **Philadelphia.**

Our New Catalogue of the Planet Jr. Farm and Garden Implements is Free to all, and we guarantee it to interest every one who plants seeds or cultivates the soil. It is a beautiful descriptive work of 16 pages, full of illustrations. We want Market Gardeners and Root Growers to examine closely our fine Garden Tools; Farmers who value Labor-Saving Tools to study out our Combined Horse Hoe, Cultivator and Coverer; and every one who has even a small vegetable garden to learn what the FirellyGarden Plow will save them. S. L. ALLEN & CO. 127 and 129 Catharine St., Philadelphia, Pa.

CLARK'S IMPROVED ROOT CUTTER

PERFECTION OBTAINED IN
Cutting Roots.
This Cutter has *received* the First Premium *at every Fair,* and has no *equal.* Do not fail to examine it.

The Neatest, Strongest, Simplest, Cheapest, and most Perfect Root Cutter in the Market.

This Cutter is built with a heavy oak frame, well bolted together; is staunch and strong, neatly finished, handsomely striped and ornamented. The cutting apparatus consists of *twenty-five Steel Knives,* (gouge-shaped), so arranged on a wrought iron shaft that they are perfectly secure; no chance of becoming loose or breaking. The roots are neatly cut in pieces suitable for feeding. No coarse ungainly pieces are left by this Cutter. A boy can easily cut 35 to 40 bushels per hour, so easily does it do its work.

☞ Don't fail to examine it.

We are manufacturing three sizes, designated by numbers,—1, 2 and 3.

Nos. 1 and 2 designed for hand use.

No. 3 is the Power Cutter and will cut 100 bushels per hour.

Price, No. 1	$12.00
" No. 2	14.00

FARMING FOR BOYS AND GIRLS. No. 41.

HENRY STEWART.

Pasturing.

We are told in sacred history, which is the oldest record of events which we possess, that Abel became a keeper of sheep while his older brother, Cain, became a tiller of the ground. Thus farming and pasturing were the first occupations of mankind. It is true that Adam was a gardener, or rather kept a garden, which produced in the period of his innocence and happiness all the fruits abundantly, and so supported him without the necessity of his laboring, but after his fall it is reasonable to suppose that he continued to gather such fruits as he could and never really tilled the ground. Pastoral life is the second step towards civilization. The savage hunts and gathers fruits and roots for his living, and wanders from place to place without any settled home. When he begins to accumulate property, which is the first indication of civilized life, he keeps sheep and cattle and lives in a tent, moving from place to place as his stock demands fresh pasture. This of course requires much space and a good deal of ground, and as men become more numerous they are crowded, and some necessarily have to become farmers and live in houses.

This very course of things is happening the great West to-day. Flocks and herds roam over the vast plains: but by-and by the sheep and cattle get too numerous and the pasture too scanty, and one man and then another takes to farming, and by-and by the prairie is dotted over with houses and wheat and corn fields and the flocks and herds go farther off, for pasturing requires a large space of ground, but yet it is a very cheap and easy way of keeping sheep, cattle and horses where land is cheap and abundant, or where it cannot be turned to other and better uses. Where land costs only a dollar or two per acre one can afford to pasture. Where it costs a hundred dollars per acre one cannot afford to use it for this purpose unless the pasture is made very rich and productive and able to support more animals than the wild pastures. Thus pasturing and the care of pastures become a branch of farming which calls for great skill and knowledge of the kinds and value of the best pasture grasses and the best soils for this use, as well as the best methods of managing such soils.

Most of us, when we think of the pasture, recall to mind a rough piece of ground at the back of the farm covered with stones and rocks and brush, with a brook running through it, in which, when boys, we used to try and catch small fish with a bent pin: and a swamp where we used to love to wade in the mud with bare feet; and so wasted our time while our parents were waiting for us to bring the cows home. And then how we used to run those poor cows home with their full udders swinging from side to side, to make up for lost time, and make believe that we had been very busy in fetching them up. Or sometimes we would coax the girls to go and gather chestnuts with us or pick up hickory nuts in the woods. Those were the days when our first little experiences in farming came to us without labor or care and which we now look back upon with pleasure and regret.

But that kind of pasturing is only a makeshift, and no good farmer now is content to keep his cows in that way. He must have a pasture in which his cows can eat and be filled in a short time, and lie down to rest and chew their cuds, and fill their udders with rich milk from the rich, sweet grass. Such a pasture requires that the soil be of the best kind, and not a piece of waste land that is good for nothing but to produce weeds and worthless plants. It does not require that the land be smooth or level, or free from stones or trees or swamp. A rough, uneven surface, with rocks here and there jutting from the sward; a few trees; a brook and a swamp even, if it be drained; will all be valuable adjuncts to a pasture. For an uneven, sloping field is generally dry and healthful in its influences on the cows or sheep; rocks and stones merely take up so much of the ground and generally the herbage around them is the sweetest; the shade of a few spreading trees is worth a good deal of money in their agreeable effects upon the cows, a rippling brook supplies the best and purest of water, and a drained swamp will produce a heavy growth of the richest grasses.

THOSE BOYS.

MARY E. COLE.

I READ in the RURAL of the rearing of pigs and of poultry, but my theme is, the rearing of boys. I think they are much more neglected than pigs or poultry, or even *farmers wives*. Farmers' boys are more frequently cared for with a view to the profit they shall bring, than to their present welfare or future manhood. Judging from appearances, they are not considered the ornamental part of the family, and though their services are frequently called into requisition the fact is seldom acknowledged. When household help is required, the boy is called in to do the weekly wash on rainy days. Some one suggests that he even peel the potatoes or sweep etc, when not employed out of doors! This being done, where is the boy's leisure? What girl has no time for books or embroidery, or an afternoon for gossip each week. When the boy is old enough he follows the plow all day, and to meet him with the empty water-pail or kindling basket is simply barbarous. If help in the house is insufficient, do not make the boy pay the penalty of that: every boy, after he goes to the field, earns more than it will cost to hire a woman to do the work of the house. The excuse that such help cannot be had, is fallacious. "The poor ye have always with you," and in every neighborhood may be found, at a light expense, those who will do the washing and ironing at their own homes.

Farmers' boys do not have any great advantages of education, and this is a good reason why their evenings and rainy days should be given them for the improvement of their minds. Let books and papers be put within their reach, and let them be encouraged to read them, and there will be less noise around the barn, less pitching of horse-shoes, less lounging in village stores on rainy days.

Again, the boys' clothing does not favorably compare with their sisters'. Not unfrequently they are left to spend their Sundays with the colts and calves, while the girls are dressed up and taken to church. I know families where the girls spend one day out of the week pulling to pieces some dress and changing its appearance for some special occasion, who cannot find time to make and starch collars for their brothers' every-day shirts or make mittens for corn husking days. It is in these boyhood days that seeds of bitterness are sown that wives reap in after years. No wonder some of the boys grow to be "barbarians," and occasionally one has no better sense than to scrub the kitchen after he has done his day's work.

NOTES.

ABOVE we give an interesting article entitled "Those Boys," in which there are many solid facts, and it has suggested to my mind a good subject for our next Discussion. It is this: "*Is it advisable to oblige children under 12 or 14 years of age to do farm work?*" I will explain a little. Some children are more mature both in body and mind at 12 than others are at 14 years of age. Some are far better able to do physical work at the former, than others are at the latter, age. What we wish to consider is, should boys and girls generally, when about the ages above mentioned, be compelled to do hard work, either on the farm or in the house. Is it best for their intellectual and physical development? Will it tend to cause in them a love or a dislike for farming? Do they, or do they not, need all these early years for education and for play? This will serve to give an idea of the way to treat the subject. Now, members of the club, make ready for a good discussion of this question, and let's see if we cannot do better than ever before. The last Discussion was a very good one, we know, but the members of the Horticultural Club should never be content with present attainments, and, therefore, let "Improvement" be our motto. What we want is a few words to the point from all, and then the meetings cannot fail to be interesting. The next Discussion will take place about the middle of January, 1882.

I receive sometimes quite a number of letters intended for the Discussions after it is too late to put them in type for that issue. Such I shall endeavor to publish, if they are interesting, the succeeding week, but it would be much better to have all letters for our Discussions in on time, say about a week before publication. U. M.

LETTERS FROM THE COUSINS.

UNCLE MARK.—My first choice of plants for the parlor in Winter would be the ivies. The English Ivy with its rich dark green leaves for decorating is a beautiful plant, it is strong and will live through almost any treatment. The ivies do not seem to mind whether the sun shines or not, or in what direction you train them. They should not be excessively watered though. I read in the Floral Cabinet that English Ivies growing over the walls of a building, instead of promoting dampness are said to be a remedy for it. I have also read that in a certain room where dampness had prevailed for a length of time the affected parts inside had become dry when they had grow up to cover the opposite exterior side So we have in the English Ivy the beautiful and the useful. The German Ivy with its smooth, glossy, light green leaves is a very rapid grower and is nice for the parlor or sitting room. Now, cousins, (I am now speaking to the girls) don't let us allow the boys to beat us in the Discussions which I think may be of real benefit to us if we take hold of them in earnest. JESSIE GURNEE.

Cottage Grove, Wis.

DEAR UNCLE MARK.—You wish us to tell what we know about house plants in Winter. It isn't much. We have not been well situated for keeping plants in cold weather. Our rooms with south and east windows best suited for them are large and heated with fire-places. We find it difficult to keep them from freezing with fire all night. We have some petunias, slips cut and rooted in the Summer. We find they do best in sandy soil and require considerable moisture. We have some choice pansies cut from last Summer's plants; they root quite easily in the house. Then we have some of the Tradescantia or Wandering Jew in a hanging basket. The two latter seem to have ceased to grow since the cold nights have commenced. We will try house plants more extensively when we are able to withstand Jack Frost better.

CHARLEY AND ALICE TAYLOR.

Deer Valley, Col.

DEAR UNCLE.—I see by the RURAL (which I carefully peruse every week), that any one can, if a subscriber, or a child of a subscriber, become a member by sending you their address, and writing you a letter twice a year. As I want to be a member, put my name on your list. My father has been a subscriber to your paper from its first issue. He has the bottom of a large book-case full of RURALS for reference, and the information he derives from them on all horticultural and agricultural matters is worth to him, he says, ten times the annual subscription. My father went to Texas last Winter to see my two brothers who are on a ranch in Bosque county. He planted the RURAL seeds there. The pinks were splendid. The asparagus good. The sorghum he thinks too coarse for the sheep, and would prefer cane or corn sown thickly. The White Elephant Potato did very well considering the drought. The oats rusted and were short and stunted, owing, I suppose, to the unusually dry weather.

Goderich, Ont. DAISY JOHNSTON.

UNCLE MARK.—I would like to tell you how we keep our apples. Living on the flat prairies our cellars are too damp for them, so we bury them in the ground (freezing does not hurt them if covered with six inches of dirt.) Last Fall we buried our apples the 14th of November. The 15th of April we took up some which were in good condition. They looked as fresh as if just picked from the trees. They were Yellow Bellflower, Rome Beauty, Rhode Island Greening, and Rawles' Janet. The 17th of May we took out the last of the Rawles' Janet and they were perfect yet. EDGAR B. SHAFFNER.

Wellman, Iowa.

DEAR UNCLE MARK.—I have not seen any letter from this place so I thought I would write one. Council Grove has about 1000 inhabitants, is the County seat of Morris County and is situated in the Neasho. The M. K. and T. railroad passes through here, and we are expecting another from the east soon. We live on a farm about a mile from town. We came here from Illinois about three years ago, and although the crops have been as large as we could have wished, still papa has faith in Kansas and hopes for better times. I would like to join the Club. MINNIE AIKEN.

Council Grove, Kas.

DEAR UNCLE MARK.—I am ten years old, and they all say I am quite a farmer. I raise corn, potatoes, beans and a little of everything that is raised on the place. I have a little field of Winter rye now. Pa takes the RURAL and I think I shall enjoy reading it the long Winter evenings. My sister sowed the flower seeds but the drought killed all of them except some lovely pinks. I would like to join your club if I am not too late. Yours truly, GEORGE GROVER.

Clover, Wis.

New Members of the Club for Week Ending Dec. 10th.

Agents wanted. $5 a Day made selling our NEW HOUSEHOLD ARTICLES and FAMILY SCALE. Weighs up to 25 lbs. Sells at $1.50. DOMESTIC SCALE CO., Cincinnati, O.

AGENTS WANTED EVERYWHERE to sell the best Family Knitting Machine ever invented. Will knit a pair of stockings, with Heel and Toe complete, in 20 minutes. It will also knit a great variety of fancy work for which there is always a ready market. Send for circular and terms to the **Twombly Knitting Machine Co., 168 Tremont Street, Boston, Mass.**

PERSONALS.

Major William Arthur, the President's only brother, has accepted a position on Gen. Haucock's staff.

Louis Pasteur, the celebrated scientist, was elected member of the French Academy last Wednesday, Dec. 7.

Gen. Hugh Judson Kilpatrick, United States Minister to Chili, died at Santiago on Sunday last, Dec. 4.

Jefferson Davis, wife and daughter arrived here from Europe on Wednesday, the 7th. He is 74, and looks hardly over 50.

Senator Beck says that Kentucky has the fastest horses, the prettiest ladies and the purest democracy in the Union. Beck, however, is often contradicted in the U. S. Senate—and out.

M. Renan in these days looks like a comfortable French priest, an occupant of some quiet village pulpit. His face is round and would be coarse were it not for the noble brow and thoughtful, searching eyes. He is a small man, thick-set and clumsy, and looks as if he liked the good things of this earth.

MAKE HENS LAY.
An English Veterinary surgeon and Chemist, now traveling in this country, says that most of the Horse and Cattle Powders sold here are worthless trash. He says that Sheridan's Condition Powders are absolutely pure and immensely valuable. Nothing on earth will make hens lay like Sheridan's Condition Powders. Dose, one teaspoonful to one pint food. Sold everywhere, or sent by mail for eight letter stamps. L. S. JOHNSON & CO., Boston, Mass. formerly Bangor, Me.

KIDNEY-WORT
DOES WONDERFUL CURES! WHY?
Because it acts on the LIVER, BOWELS and KIDNEYS at the same time.
Because it cleanses the system of the poisonous humors that develope in Kidney and Urinary Diseases, Biliousness, Jaundice, Constipation, Piles, or in Rheumatism, Neuralgia, Nervous Disorders and Female Complaints.
SEE WHAT PEOPLE SAY:
Eugene B. Stork, of Junction City, Kansas, says, Kidney-Wort cured him after regular Physicians had been braving for four years.
Mrs. John Arnall, of Washington, Ohio, says her boy was given up to die by four prominent physicians and that he was afterwards cured by Kidney-Wort.
M. M. B. Goodwin, an editor in Chardon, Ohio, says he was not expected to live, being bloated beyond belief, but Kidney Wort cured him.
Anna L. Jarrett of South Salem, N. Y., says that seven years suffering from kidney troubles and other complications was ended by the use of Kidney-Wort.
John B. Lawrence of Jackson, Tenn., suffered for years from liver and kidney troubles and after taking "barrels of other medicines," Kidney-Wort made him well.
Michael Coto of Montgomery Center, Vt., suffered eight years with kidney difficulty and was unable to work. Kidney Wort made him "well as ever."
KIDNEY-WORT
PERMANENTLY CURES
KIDNEY DISEASES,
LIVER COMPLAINTS,
Constipation and Piles.
☞It is put up in Dry Vegetable Form in tin cans, one package of which makes six quarts of medicine. Also in Liquid Form, very Concentrated, for those that cannot readily prepare it.
☞*It acts with equal efficiency in either form.*

GIVEN AWAY TO EVERYBODY!
Grand Offer for the Holiday Season! Six Valuable and Useful Premiums Positively Free to All! Wishing to obtain for our universal Agricultural and Household Paper, Cottage and Farm, the largest circulation ever obtained by any similar publication in the world, we make the following unprecedented offer: Upon receipt of Only Fifty Cents in postage stamps we will send Cottage and Farm for One Year, and to every subscriber we will send, Free and postpaid, Six Valuable and Useful Premiums, as follows: 1.—The Japanese Magnetic Fish, very amusing and attractive to old and young. The fish are packed in a pretty box made of wood, and accompanying them is a jointed bamboo fish-pole, furnished with a fine silk line and steel hook. 2.—Plain Gold-Plated Ring. This ring is of a good quality of composition, and will not tarnish or wear well and give excellent satisfaction. It is a plain gold-plated ring, and suitable for either lady or gentleman. 3.—Set of Pearl Shirt Studs. This premium consists of a set of three beautiful Pearl Shirt Studs, set in a good quality of gold plate, with spiral wires. Gentlemen subscribers cannot fail to be delighted with them.

4.—Fine Silver-Plated Thimble. This is of a good quality of silver plate, very durable, and would not be known from a solid silver thimble. 5.—Handsome Pocket Comb, in Case, made of a very fine quality of horn, far superior to rubber in beauty and durability, enclosed in a strong case, so it may be carried in the pocket if desired. 6.—Twenty-Six Ladies' Embroidery and Needle Work Designs. These are among the latest publications of the leading fashion journals of Europe. Each one is accompanied by plain and explicit directions. Our illustrations show but five of the six premiums we offer. Remember that for Fifty Cents we send Cottage and Farm One Year, together with all the above described premiums. The premiums are not cheap, trashy articles such as are usually offered, but are guaranteed to be of good quality. All the subscribers that we secure this year we desire to retain for future years; hence we cannot afford to give as premiums anything but genuine, first-class goods. COTTAGE AND FARM is an 8-page, 32-column illustrated family paper—one of the very best published. It is devoted to Agriculture, Horticulture, Household Topics, Practical Recipes, Ladies' Fancy Work, Stories, Poetry, Wit and Humor, News, etc., and every number contains hints and suggestions worth a year's subscription to any one. This is positively the greatest and most liberal offer ever made by any reliable publisher, and is made solely for the purpose of introducing our valuable paper. Send at once, and if you are not perfectly satisfied with your bargain, *your money will be cheerfully refunded.* As to our reliability, we refer to any publisher in this city, as we have been long in business and have an established reputation. Show this advertisement and send us four subscriptions, and we will send you an extra copy, with the premiums, free. Address, S. H. MOORE, Publisher, 3 Park Place, New York.

Humorous.

AN exchange says: "The bicycle is a great thing to put flesh on a man's legs." It is also a great thing to take flesh off a man's nose and other portions of his face.—Norristown Herald.

"TOMMY," said a mother to her seven-year-old boy, "you must not interrupt me when I am talking with ladies. You must wait till we stop, then you can talk." "But you never stop," retorted the boy.

"DOES our talk disturb you?" said one of a company of talkative ladies to an old gentleman sitting in a railway station the other afternoon. "No, ma'am," was the naive reply, "I've been married nigh on to forty years."—Hartford Times.

PLAYING BARNYARD.—New Haven Journal: One day Billy and Sammy were playing in a mud hole, and Bill said:

"Now, Sammy, les play we was a barnyard. You be the pig, and lie down and waller, and I'll be a bull and beller like everything."

So they got down on their hands and knees, and Sammy he went into the dirt and wallowed, while Billy bellowed like distant thunder. By-and-by Sammy came up muddy—you never saw such a muddy little fellow—and he said:

'Now, you'll be the pig, and let me beller."

But Billy said: "I ain't a very good pig except for dinner, and it'll be time nuff for you to beller when your mother sees yer close."

"ROTATION OF CROPS."

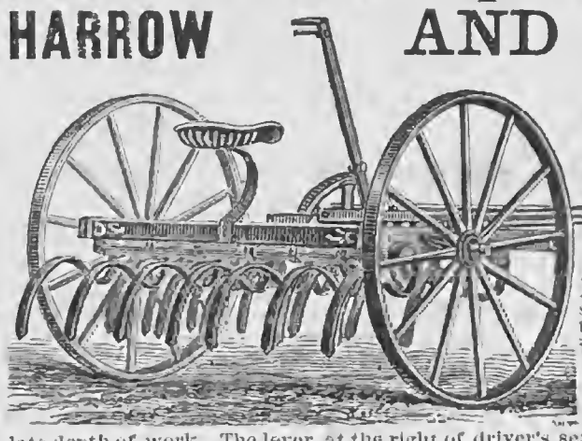
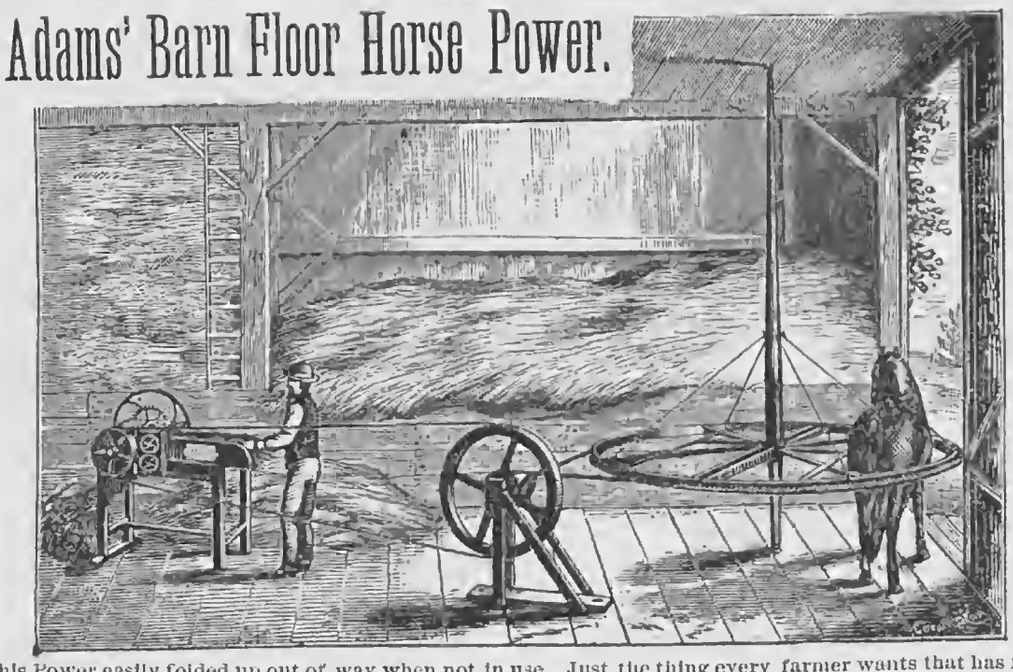
The Albion Spring Tooth Sulky HARROW AND CULTIVATOR.



This celebrated Tool has been thoroughly introduced during the season of 1881, in the East and through the West, and hundreds of them have passed into the hands of Farmers, tried and purchased on their merit. This Tool, combined, is a perfect Harrow, a perfect field Cultivator, a perfect sulky Corn or Crop Cultivator; with its force feed Broadcast Seeder Attachment, sowing all kinds of Grain evenly. It is a perfect Seeder. The two sizes, No. 1 and No. 2 have Eighteen and Fifteen Teeth, made of the best spring steel, oil tempered, and are long and thin penetrating the hardest ground easily. The elasticity and spring of the teeth working through the soil imparts a yielding, vibratory motion, which instantly frees them from all obstructions. The frame is mounted two feet from the ground on wheels four feet high, and is adjusted by the axles up and down to regulate depth of work. The lever at the right of driver's seat controls the teeth instantly, regulating the depth and pitch of teeth, or elevating them for driving on road or for any purpose. This tool is strongly made and nicely finished, and will do more and better work than any other Harrow and Cultivator ever offered to Farmers.

Manufactured by ALBION M'F'G CO., Albion, Mich.

Adams' Barn Floor Horse Power.



This Power easily folded up out of way when not in use. Just the thing every farmer wants that has feed to cut, corn to shell, or anything 1 or 2 horses can do. Agents wanted. Send for circular. 2-horse Power Jack Belt, and 18 feet flat Belt, $40. SMITH & WOODARD, Manufacturers, KALAMAZOO, MICH.

The Herdsman.

A GROUP OF POLLED CATTLE.

Much space and a good deal of information have been of late given in our columns about the Angus Polled cattle. We have given them such prominent notice because we believe that a more general knowledge of their characteristics and value would be useful, and because we do not in any way sympathize with the popular prejudice against them on account of their want of horns; indeed we should rather say absence of horns, because the word want would tend to indicate that the horns were something needful and valuable, whereas we believe they are neither. The great requirement of American agriculture for many years to come will be beef cattle of the best breeds, and as the Scotch polled breed has met the best of Short horns and Herefords in the ring, and has occasionally beaten them and taken the blue ribbon from them, it has certainly a right to some recognition from an agricultural journal as well as from breeders and graziers. We present the accompanying portraits of our heifers belonging to the herd of Mr. Ferguson of Cowper-Angus, Scotland, as worthy of study as typical animals showing the points of the breed in an excellent manner. The engraving is from a photograph, and as a work of art alone, is worthy of commendation. The discussion of the merits of Polled Cattle in the succeeding columns obviates the necessity of a lengthy account of them from us in addition to our former articles

POLLED CATTLE.

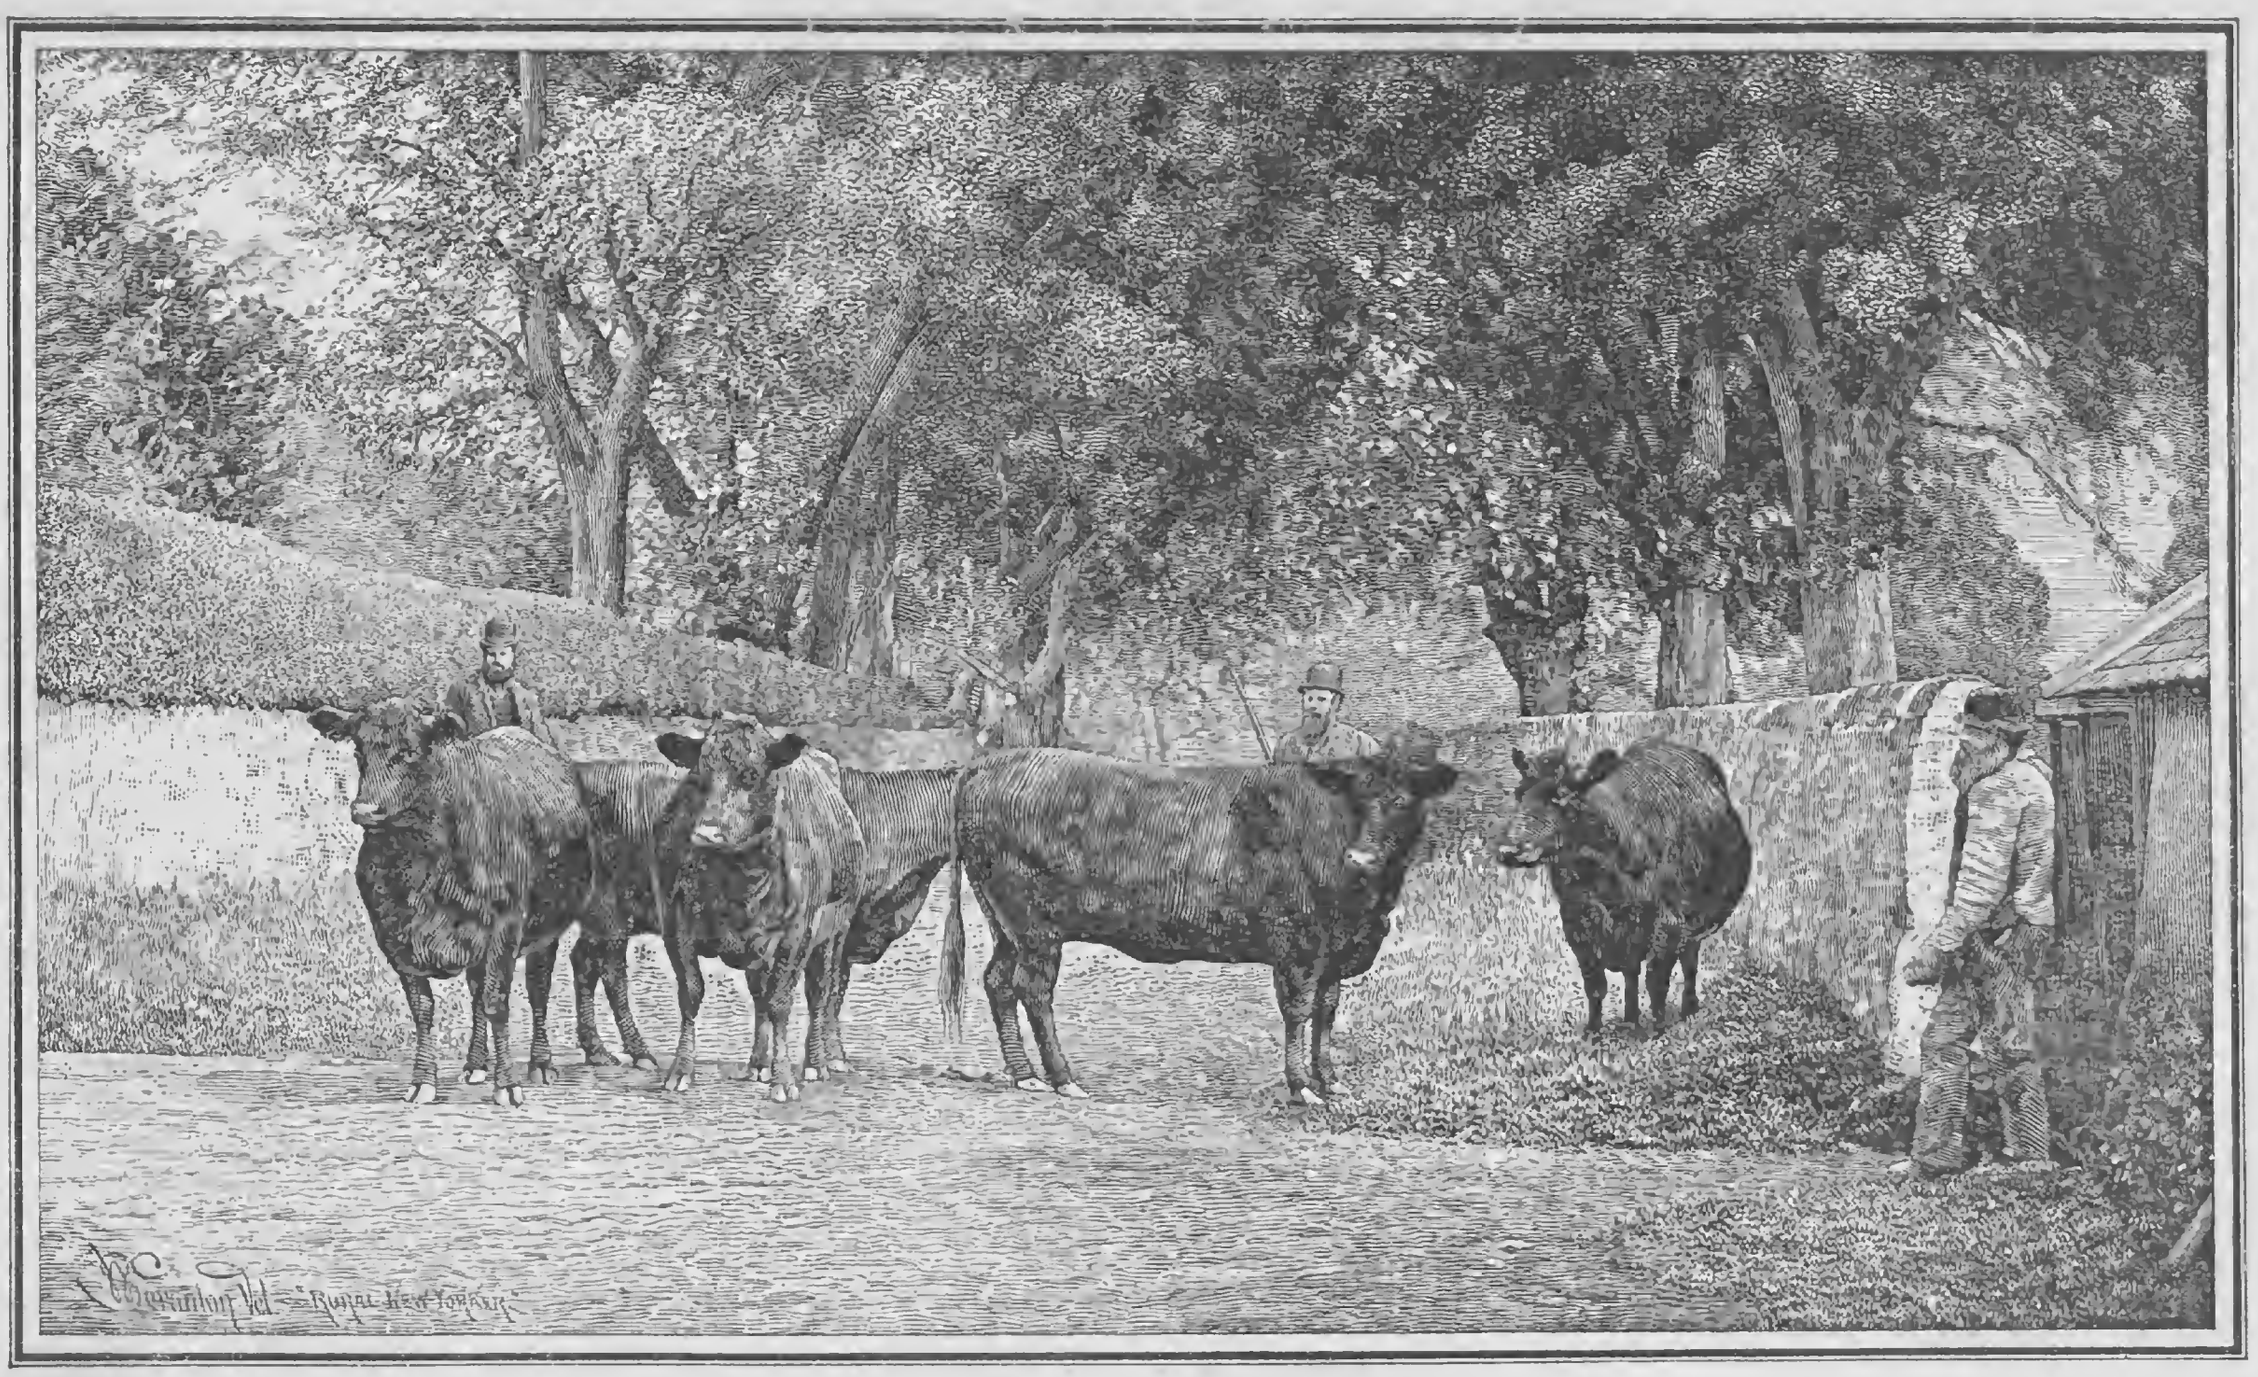
G. F. FABER.

My attention has been called to some statements with reference to polled cattle contained in the Rural of Nov. 26 in "Notes by a Stockman" which are certainly erroneous in some particulars and reveal in regard to these cattle somewhat of the prevailing ignorance of which the writer makes mention, and he might truthfully have added that a great deal of prejudice accompanies the ignorance. I very much doubt if the writer of that article has ever owned polled cattle; if so his experience differs greatly from that of others who have them. Admitting his assertion that "the proportion of cross or savage cattle will be found quite as great among the polls as among the horned cattle," of the two I think he would prefer to take the risk of an encounter with the polled animal. But with my experience I cannot admit this assertion. I have owned several aged polled bulls, none of which have been vicious. In leading them I use nothing but a rope tied to the ring in the nose. I never owned an aged horned bull that I felt safe in leading so. I have never heard of any person receiving serious injury from an encounter with a polled animal, while probably all know of such injuries having been inflicted by horned beasts in their own vicinity. Again, my experience with the cows of the two varieties has been as follows: For many years I owned horned cows and during the time quite a number were entirely ruined for dairy purposes in consequence of injuries received from the horns of others. My neighbors have been more unfortunate, losing the lives of the animals injured. During the last eight years, I have had polled cows and to my knowledge they have never done the slightest injury to any animal on the farm.

"Stockman" closes his remarks with the assertion that "in the dairy these cattle will never become popular, and simply because they are not so profitable as the Jerseys, the Ayrshires, the Dutch, the Short-horns or good average natives, that is, considering the market value of these last." In the experience of others as well as of myself this is far from true. There are families of polled cattle that for the production of butter, both as to quantity and quality, are fully equal to the far-famed Jerseys. The red or dun polled cows of Suffolk County, England, have long been noted for their superiority as milch cows, while in the adjoining county of Norfolk the red polled cattle, there designated as "Home-breds" are little, if any, inferior in this respect. At the Suffolk County (England) Fair of June 30, 1881, the red polled cow "Wild Rose" received the prize for the best milch cow. She was placed in charge of the steward of the fair and produced thirteen quarts of milk in twelve hours, which was less than she had given on named above. The milk from the Red Polled cow showed one-and-one-fourth inch of cream, as did also that from the native cow, this being considerably in excess of that on the other samples tested.

Native cows are referred to above and their market value brought into consideration. Have we not native polled cows of no greater market value fully their equal for dairy purposes? In conversation with farmers I find that they have a very high opinion of the native polled cows or "muleys" as milkers, and in speaking of them I have often heard the question asked, "Did you ever know of a "muley" cow that wasn't a good one?"

Our author above quoted adds: "Let us have the truth anyhow and give the polled cattle their due." That is the only favor that breeders of polled cattle will ever ask of their competitors of the horned breeds, and that their stock shall not be subjected to the premature judgment of persons so strongly prejudiced as to be unable to detect any good quality in them. It may be, as this writer predicts, that there is going to be a polled cattle boom, and if so there may be a great depreciation in the values of horned stock; but let not the advocates of horned cattle despair. It is not impossible that there may



GROUP OF POLLED ANGUS OR ABERDEEN CATTLE—(From a Photograph)—Fig. 561.

eventually be a demand for those specimens of the breed extant, that shall cause them to realize large prices. I note that at a recent sale of menagerie stock a two-horned rhinoceros sold for the large sum of $17,100, it being the only one of the kind in the country. It is perhaps not altogether improbable that at some future date a similar demand may arise for one-horned and two-horned speci-

mens of the bovine species, now so common in the country.

TEMPER OF POLLED CATTLE.

FRANK B. REDFIELD.

IN an article under the above caption in the RURAL NEW-YORKER for December 3, those who have had experience with polled cattle are requested to furnish information on the subject to the RURAL.

My intimate experience with polled cattle covers but the past two years, my first importation of Angus cattle having been made in 1879. First, on the subject of "temper," I will say that polled cattle are much more quiet, particularly in their treatment of each other, than horned cattle. I can show every day my water-trough full of polled heads, as many as can get up to it at one time to drink and there is no fighting and crowding. *They know they have no horns.* But grant in some cases a disposition to do injury, and what does it amount to in comparison with the same temper in an animal with a pair of ugly, sharp horns? It is enough to say—and I think without exception all who have tried polled cattle will say the same—that I will never have any more horned animals on my farm. I have had my share of experience in the last 20 years with horned cattle in the way of injury, very serious injury, to man and beast, and *I mean to have no more of it.*

I have had a few imported Angus cattle that had never been handled before shipment, and they have been and are very timid and wild, making them hard to handle. But with all their wildness in their intercourse with their fellows they show the characteristic mildness of almost all hornless cattle. Those of much experience with cattle of any variety know that all animals allowed to run unhandled as calves and longer, will be very wild and in many cases untamable. I have had horned cattle possessed of the very devil simply because they were not handled while young, and I know the difference between them and polled cattle. Again, I say only experience is necessary to determine one to have none but polled cattle. Why, it is a well known fact that in the countries where polled cattle are best known the *removal* of the horns from animals having them has been much practiced and it has been found necessary to pass laws forbidding the cruelty—although the most suffering in the end may be caused by not removing them. To me one fact is very significant, and that is the wonderful prepotency of polled bulls when bred upon horned cows. Why should this be so if it were not a provision for some all-wise purpose?

On the subject of the superior feeding qualities, etc., of polled cattle, the article in the RURAL of Nov. 5 leaves me little to say. On the subject of transportation it hardly seems necessary to say anything. The disadvantage of horns is patent to any one. It is only necessary to watch a few lots of cattle undergoing transportation on rail and shipboard to appreciate this fact. I am sanguine enough to believe that the next 25 years will see the horns bred off from a large majority of the cattle of the country and that breeders generally will wish for horns on their *horses* about as much as they would wish to have them on their cattle.

Batavia, N. Y.

NOTES BY A STOCKMAN.

THE extent of the great cattle interests of the West may be realized in part perhaps by considering the operations of a few individuals. A private ranch in Colorado formerly owned by Jones Brothers was sold recently to a stock company for the sum of $625,000. Another in Texas owned by a Captain Kennedy was purchased by the same parties for $1,250,000. This Texas ranch covers 300,000 acres of land and is stocked with 50,000 cattle and 3,000 horses and mules. These transactions are the largest cattle sales ever made; but by and by they may appear trifling when compared with future transactions; for the reason that the business is rapidly concentrating in a few hands and in wealthy joint stock companies, many of them composed of foreign capitalists.

ONE can scarcely realize what a crowd of cattle 50,000 would make up. If they were placed in line head to tail they would reach 100 miles; and if packed in a drove with comfortable room to move they would occupy 100 acres of ground. But there are many larger stocks of cattle owned by single individuals than this particular one.

THE editor of the RURAL has charged me to tell the truth in these notes, without regard to consequences, believing that no interest is served by deceit and misleading. As a matter of course truth telling will not fail to involve a good deal of criticism from persons who have strong opinions, prejudices, and hobbies; not to mention special interests to serve. I desire to do strict justice, and when adverse criticism proves to me that I am mistaken, I will most cheerfully acknowledge the corn. But as I write nothing that I do not firmly believe, and little but what I know, I promise my critics that nothing short of the clearest evidence and matters of fact can have sufficient weight to alter my judgment and views of things.

FOR instance, X (page 812) takes me to task in regard to polled cattle, and denies my statement that these cattle will fight as savagely as other cattle and that the absence of horns does not change their disposition, however much it may prevent them from wounding each other. He also objects to my statement that the frequently offered claim that more of these cattle can be put in a car than of horned beasts is unfounded; and yet in both these cases he fails completely to refute my assertions which are based on actual knowledge. I too, like X, made the acquaintance of these cattle many years ago. They were then not all naturally polled, but some of them had horns which were sawn or knocked off when a drove was put on the road for the English market. A third of a century ago I knew these cattle, and during a residence in England of five years often saw them in their native homes, and droves of them on the road to the London market. Part of the time I spent on a Norfolk farm where "black cattle," as they were called, were fed for a while on turnips and straw to gain flesh which they had lost in their 400-mile journey on foot before going to market. I have seen repeated fights among these cattle and the drovers have had as much difficulty in managing them as other cattle. X admits all I claim or stated when he says "occasionally a naturally truculent beast could be found and sometimes an animal would show fight" etc. etc.; and no more than this can justly be said against horned cattle, which, as a rule, are *not* naturally vicious.

BUT in regard to crowding these in a car, Youatt, 47 years ago, never dreamt of a railroad car when he wrote of these cattle, and his evidence must be ruled out as irrelevant. Again, dishorned cattle are not polled cattle, and a poor beast which has had his horns sawn or knocked off, naturally would feel much more gentle and docile, with his sore head, than a naturally polled one. This evidence also should be ruled out as irrelevant. Then Prof. Sheldon when he says "Americans are turning their eyes wistfully in the direction of polled cattle," mistakes most awfully, for there is no such wistful desire on the part of the Americans for these cattle, especially for dairy purposes. A few newspaper writers and a few importers and breeders are trying to get up a boom, and a few quiet business men are experimenting with them, and that is all. I don't care much for opinions, for these can be had by the cord or by the thousand; as everyone, however little he may know, has his opinion; but opinions never changed a man's belief. Facts are what I am after and not opinions.

AND X gives me a fact which just suits me, when he says "the width of the body and not that of the horns has gauged the room for each animal." Precisely. That is just what I stated, at least in substance; that horned cattle were so closely packed that if polled cattle were packed any closer they would be suffocated. How can space be gained, when even now, the width of the body gauges the room for each animal? Would the drovers use a press to pack these animals because without horns they could be squeezed a little closer. I grant the advantage and comfort gained by the absence of horns to the poor beasts. But that is not what is claimed. The claim is that more can be packed in a car, and while I admit that it might be done, I aver that it would be at the risk of suffocation. And X bears me out completely in my statement.

THERE are many points of value about the polled cattle; but they don't excel all other kinds. They can find a place here, which they can fill with great profit. This has been pointed out in the RURAL already and I need not say anything on the subject further. Let us avoid, however, getting into a craze about these cattle and putting up the notions of Scotch breeders who may think we are looking wistfully for their stock and as they think we are overflowing with wealth, they may on that false ground, mark up their prices 200 per cent, just as the Jerseymen have done with their cattle. Whenever a boom is got up we have to pay the piper, and the other fellows do the dancing, which is what I object to.

ANOTHER sale of Jersey cattle has come off and the prices paid are again unprecedented. A bull, Farmers' Glory, was bought by the "Sugar King" for $3,500, and a cow for $2,100; another bringing $1,400. There is no objection whatever to this kind of business, any more than to a rich man paying his thousands for a diamond or a picture. But it is not agriculture; only playing at it.

I NOTICE that a writer in that diletante agricultural publication called the Journal of the American Agricultural Association, is of the opinion that Mr. Havemeyer is showing us how to farm in the most approved style and most meritorious manner. It would be a most instructive comment on that extraordinary article, if Mr. Havemeyer would give an account current of his farm operations, showing precisely the cost of a pound of butter made from the cows in his dairy. Mr. H. is a sensible man and, doubtless, would cheerfully admit that he farms for amusement, and not to show "how fields are won" for the instruction of farmers who have to make a living by their farms and never could afford to pay more than $100 for the best cow that ever breathed or milked solid cream or lumps of butter.

The Swine-Herd.

VICTORIA PIGS.

COL. F. D. CURTIS.

THE Victorias may be classed among the American families or breeds of swine. They originated at Kirby Homestead, Charlton, Saratoga County, New York. A quarter of a century ago the writer, who is the son of a large farmer, conceived the idea of establishing a breed of swine which should meet the requirements of Eastern farmers for early fattening and at the same time be better adapted to the extremes of heat and cold than any of the white English breeds. He had the notion then as now that American breeders should strike out for themselves, and produce stock which would be adapted to their climate and markets, and not be dependent upon the skill of Great Britain.

With this feeling of home pride and independence he began the improvement of the pigs inherited from his father, which combined the blood of the Irish Grazier and pigs known as Byfield of which his father had obtained a cross. The latter were probably of English origin and with the Irish Graziers have long since been bred out in this country as distinctive breeds. With this foundation crosses were made with the best white boars with erect ears, to be found in the country. About 20 years ago the improved stock were named Victoria in honor of the Queen of England.

Subsequent crosses followed of Yorkshire and Suffolk and of a boar obtained in Westchester County, N. Y., of a Mr. Miller, said to be of imported stock, a remarkably well coated animal. In these various crosses several families were established which have been crossed upon each other for a number of years, resulting in the establishment of a uniformity of characteristics which now entitles these hogs to be classed as thoroughbred. Like all other white hogs, they have a few bluish or black spots in the skin, the hair upon them being white. These spots often increase in number as the pigs become aged. Several boars were kept in the herd on the farm at Kirby Homestead, and their progeny carefully selected for breeders as they came the nearest to the standard of the proprietor. One boar, the Crown Prince, on account of his superior excellence was kept until nearly nine years of age when he was castrated and slaughtered and attracted general commendation on account of the softness of his skin and his good appearance as a porker.

A son of Crown Prince is now in use and is considered to be very near, if not quite perfection. Both of these boars have obtained first prizes at the fairs of the New York State Agricultural Society.

Readers of the RURAL undoubtedly have noticed the remarks of "Stockman" in a recent number, which may be appropriately quoted as from a disinterested authority. He says: "The Victoria breed of swine is an improved Suffolk and an improved Yorkshire; at the same time it has the fineness of the Suffolk without its tenderness and its excessive tendency to fat, and the size and fleshiness of the Yorkshire without its coarseness. Its skin is thin and fine; the hair is fine and abundant; it has length of body with depth of side and shoulder and an excellent ham * * * * At the recent fat cattle show some Victorias from Indiana were exhibited, which are reported to have averaged 360 pounds of weight for pigs from six to ten months old."

These pigs have been distributed quite extensively over the United States, and at the National Swine Breeders' Convention held at Indianapolis in 1872, the following standard of characteristics was adopted: The color is pure white with a good coat of fine soft hair. The head thin, fine, closely set on the shoulders; face slightly dishing. The snout short; the ears erect, small and very light or thin. The shoulders bulging and deep; legs short and fine. The back broad, straight and level, and the body long; the hams round and swelling and high at the base of the tail with plaits or folds between the thighs The tail fine and free from wrinkles or rolls. Feathers or rosettes on the back are common. The skin is thin, soft and elastic. The flesh fine-grained and firm with small bone and thick side pork.

WHAT! CORN NOT GOOD FOR PIGS.

I SEE by a late RURAL that our friend Col. F. D. Curtis objects very much to feeding corn to swine. Corn is the natural food of the hog; there is nothing the animal prefers to it and it will eat no kind of food when it refuses corn. In my experience for 40 years I have never had a pig or hog affected with fever or inflammation from feeding corn. I have had sick pigs, but their ailment was due to filthiness in feeding or to a lack of charcoal, sulphur or salt to keep the stomach and digestion in a healthy state. I have yet to learn of good healthful meat being made from any animal unless it was in condition to thrive rapidly. I know of a litter of nine pigs in Hyde Park last Summer that had no other feed but clear corn meal and cold water; they were washed every day with hydrant water and kept perfectly clean. They weighed at eight months old 250 pounds apiece and brought 10 cents per pound dressed for market. Whoever wants lean, slab-sided pork can have it by getting some kinds of swine that never will fatten; but their meat is never wholesome as food for man, whereas a good, thriving pig that eats corn or any other food and thrives at the rate of one pound a day or even a little less, makes healthful meat for those that like pork as I do. I was raised on pork and Johnny-cakes and boiled dinners.

Tioga Co., N. Y. A. COLVIN.

A Heavy Young Pig.

I notice in reports of the Chicago Fat Stock Show that a pig 198 days old, weighing 293 pounds, is thought very heavy. I shut up four Poland-China pigs to feed when they were 130 days old; the best one weighed 158 pounds. Twenty-three days afterward I weighed it again and it had gained 70 pounds, weighing then 228 pounds. At 180 days it weighed 299 pounds. I killed it November 15, being then 195 days old, and it dressed 270 pounds; live weight, 335 pounds. Thus it dressed a trifle over 80 per cent. of live weight. The feed before shutting it up was skim-milk swill. After shutting it up it was fed corn and oat screenings ground together, mixed up with sour swill one mess beforehand. The four were fed together, and the others were nearly as good as this. It gained some of the time over three pounds per day; average gain, 1¾ pound per day. R. J. R.

Springwater, N. Y.

Dairy Husbandry.

IS THE CREAMERY ALL GAIN.

DAIRYMEN have been used to claim that one great advantage of the creamery system was that it relieved the women from the care of the dairy and from the labor of attending to the cream and making the butter. This claim is undoubtedly well founded, but it may be questioned if this relief is all gain or if it is not accompanied by a serious loss to the dairymen and farmers without any adequate advantage. Now we completely abjure the theory or belief that freedom from such labor or care as may be well and easily undertaken by women, is an unmixed benefit. There is a good deal of nonsense and foolish gush about this business, and sensible, practical women have no desire to abandon all employment of such light kinds as will not overtax their strength or interfere with household and family affairs, and their opportunities for study and intellectual pursuits and other recreations. The dairy is especially well suited to the feminine disposition and capability. A man may manage the cream and make butter as well as a woman can—sometimes; but he rarely possesses those instincts of neatness, order, regularity, deftness, cleanliness in details, and those other little niceties which go to make up the best quality of butter, and which are the especial characteristics of the feminine mind and hand. And it is a question if the women who are still burdened with the drudgery of butter making; the slopping over pans, pails, and uteasils, have not more abundant work laid upon them in this way through the want of neatness common to the men.

We have observed much of this and especially how a man will not hesitate to plump down the milk pail in his off-hand manner quite neglectful of the fact that it may rest

upon a quantity of filth; while a women will carefully gather a handful or two of clean litter to protect the bottom of the pail. In the after washing of the milk pails this difference is a serious item in the labor of cleansing the utensils in that it brings into the sink the foulest and most penetrating odors of the stable. But market reports tell the tale in the most convincing manner; and just now we find that creamery, June packed butter is quoted at 18 cents per pound; while the top of the market is over 40 cents. When the woman was queen of the dairy, June-packed butter brought the highest prices. Then the butter buyer thrusting his tryer into the firkins and tubs, fetched up a sample of butter, not "gilt-edged" only, but golden all through and of that delicious, nutty flavor which told of the fresh June grass, "the sweet breath of the heifers," and the perfect manipulation of the neat and skillful dairywoman. What a falling off is there when June creamery is only four cents above the value of "all sorts," grease included. If this is all the creamery has done or can do for June butter, it is a pertinent question to ask, "is the creamery all gain?"

Remedy for a Kicking Cow.

I think that the success F. S. C. met with in the management of his kicking cow (see page 812) was something marvelous. I have handled hundreds of cows, but there was not one among the number that would not, if tied in the style he describes, have thrown herself, and perhaps broken either her legs or neck, or both. If a kicking cow cannot be managed by "moral suasion," fasten her by the head in some manner, then tie a large cord or rope around the body just back of the fore-legs, with a stick twist the cord tightly, and the cow cannot kick. Milk as quickly as possible, and remove the cord, as it evidently gives the cow considerable pain. After a few times it will only be necessary to slightly tighten the cord, and in a short time the kicking propensity will disappear. NELSON RITTER.

Onondaga Co., N. Y.

Field Crops.

NOTES FROM THE EXPERIMENT GROUNDS OF THE RURAL NEW-YORKER.

A POTATO RACE.

IN order to test the yield and quality of some of the new kinds of potatoes which have come to us very highly commended, all were planted, manured and cultivated in the same manner in a well drained clayey-loam soil that seldom suffers from drought. A thin spread of stable manure on the surface spaded under was all the fertilizer used. The drills were two-and-a-half feet apart—the pieces or eyes placed one foot apart by measure.

ANDREWS' WHITE ROSE, sent to us by Mr. W. L. Bishop, Le Roy, Genessee Co., N. Y. Planted April 19. Eighteen tubers were cut into 215 (single) eyes, weighing 9¼ pounds. Of these 200 grew, the first sprouts appearing May 9. The plants bore no blossoms. The yield was 389 pounds, or six bushels two pecks and six quarts. The vines died August 25th. The quality of this potato is the same as that of Early Rose.

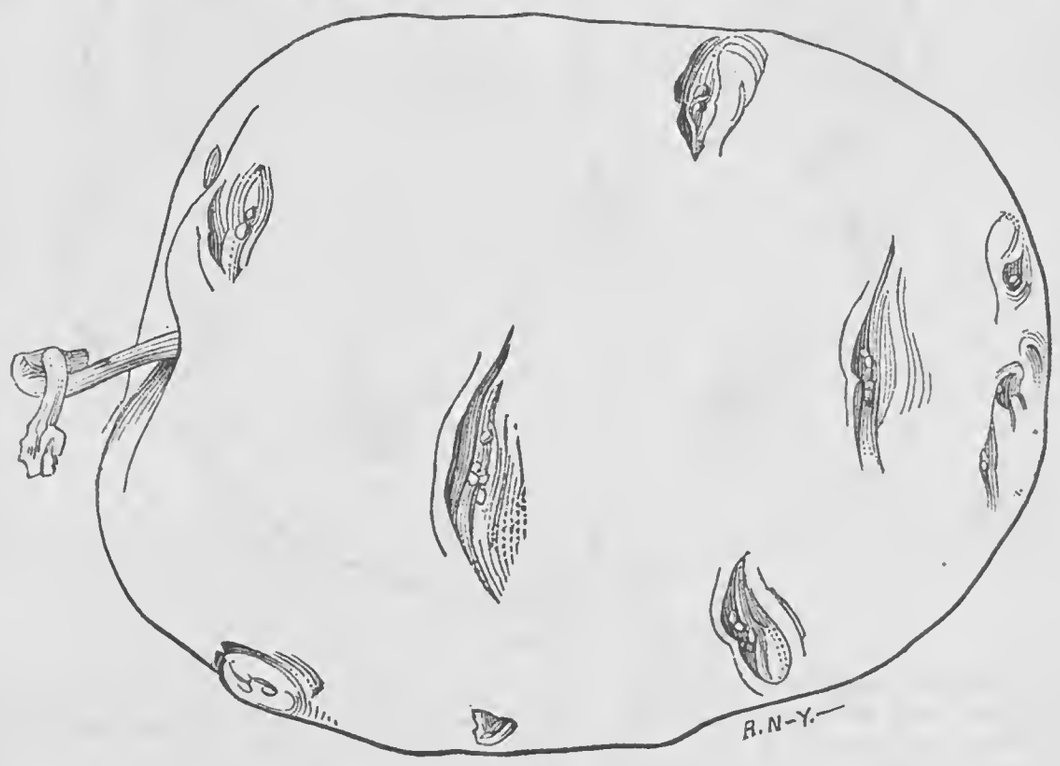
PRIDE OF AMERICA, from B. K. Bliss & Sons, were planted the same date (April 19). Thirteen tubers were cut into 155 (single) eyes, the weight of which was four-and-a-half pounds. Of these 125 grew. First sprouts appeared May 8th. Blossomed June 25. Ripened September 5. Yield 193 pounds, or three bushels and one peck. The flavor of this potato is the same as that of the Early Rose—fine-grained and mealy.

ROSE MAGNUM BONUM Potatoes were sent here by Mr. Rose, the originator, whose address has not been retained. They were planted April 20—10 tubers, 114 eyes (single), weight four pounds. Of these 102 grew, the first sprouts appearing May 8. They blossomed June 20, and ripened Aug. 26. Yield 104½ pounds, or one bushel three pecks and four quarts. Eyes are deep, skin white, roundish in shape, potatoes uniformly of large size cooking mealy; quality good, having more of the potato or nutty flavor than those of the Early Rose class.

ENGLISH MAGNUM BONUM.—We reported very favorably upon the *quality* of this variety last year from having eaten imported potatoes. They were judged to possess a rich, oily flavor, all their own. Our soil, however, does not suit them. They cook soggy, with none of the characteristic flavor of the imported tubers. Planted April 20, 27 potatoes, 190 eyes, weighing four pounds, of which 165 grew First shoots appeared May 11, blossoming June 26, ripening Sept. 5. Yield 160 pounds, or two bushels, two pecks and seven quarts.

WHITE ELEPHANT.—Planted April 20, 10 tubers; 179 single eyes, weighing 4¾ pounds, of which 176 grew. First sprouts appeared May 11, blossoming June 13. They ripened Sept. 20. Yield 279 pounds, or four bushels and three pecks. Comments upon the quality of this potato are unnecessary, as it was sent to all the subscribers of the RURAL NEW-YORKER who applied, in its Free Seed and Plant Distribution of 1880-81. The reports from nearly every part of the country show that it will probably become one of the most popular late potatoes in cultivation.

MAMMOTH PEARL, sent to us by J. M. Thorborn & Co., of New York, was planted April 20. Ten tubers, 145 eyes, weighing four pounds seven ounces. Of these 118 grew, the first shoots appearing May 9. No blossoms. Ripened Sept. 14. Yield 191½ pounds, or three bushels and six quarts. Same quality as potatoes of the Rose class.



MAMMOTH PEARL.—FROM LIFE.—FIG. 559.

BELLE POTATO was sent to us by Isaac F. Tillinghast, of La Plume, Pa. Planted April 20. Four tubers, 78 eyes, weight 3¼ pounds, of which 73 grew. First sprouts appeared May 8, blossomed June 7, ripened August 20. Yield 68 pounds, or one bushel and six quarts. Though in flavor we could not distinguish this from Rose potatoes, it did not boil so mealy. The flesh is rather coarse.

JORDAN'S PROLIFIC.—Sent by J. Woodruff & Son of Ripon, Fond du Lac Co., Wis. One tuber, 19 eyes, weighing half a pound, of which 18 grew. First sprouts appeared May 8. Blossomed June 25, ripened August 27. Yield, one peck four quarts, or 20½ pounds. Quality of the best of the Rose class.

The yields, beginning with the greatest, are given in the following order: 1, Andrews' White Rose; 2, Mammoth Pearl; 3, White Elephant; 4, Pride of America; 5, Jordan's Prolific; 6, Rose Magnum Bonum; 7, English Magnum Bonum; 8, Belle.

REMARKS.—Rose Magnum Bonum is the most uniform in size and shape. White Elephant is the next most uniform in size and shape—Belle next. Jordan's Prolific and Mammoth Pearl were the least uniform in *shape*. Pride of America and Andrews' White Rose were least uniform in *size*. The largest in size were, first, White Elephant; second, Mammoth Pearl; third, Andrews's White Rose. The best keepers, judging at this date, are, first, Rose Magnum Bonum; second, Mammouth Pearl; third, White Elephant. The poorest keepers are Andrews' White Rose and Pri e of America.

Our illustrations of Mammoth Pearl, Belle, Rose MagnumBonum, and Andrews' White Rose are from medium-sized potatoes which seemed to be typical in shape, number and depth of eyes, etc. The other kinds of potatoes tested have already been illustrated in the RURAL NEW-YORKER. The Pride of America was most injured by grubs, Andrews' White Rose next. The Mammoth Pearl was the least injured by grubs, and next, the Rose Magnum Bonum.

Farm Economy.

THE BEST CROPS TO RAISE?

THE five-field system of rotation is general in this section, commencing with corn one year, and the second year oats, followed in the Fall by Winter wheat, Timothy seed being sown with the wheat in the Fall, clover in the Spring; fourth year, grass for pasture; fifth year, mow for hay, and aftermath used for pasture. Probably this is as good a selection of crops as can be grown in this latitude. I think where land is suitable for potatoes that they pay better than oats where a market is convenient and the necessary force is on hand to plant and cultivate them. They are a crop that will not admit of delay in cultivating, and the bug warfare must be decisive or the crop is lost. Flax may pay, but I have had no experience with it. I believe a better rotation would be six fields, letting the grass grow three years instead of two, the last crop being used as a fertilizer for the succeeding crop of corn, this being equal to a dressing of manure that would cost at least $10 per acre. To benefit the land it should be left to decay without mowing or pasturing, the shade being of as much benefit to the soil as the decaying grass. As a matter of profit, it will not pay to let grass fall on the ground with hay at $20 per ton. The whole matter is a question of dollars and cents. If the rent of the land is more than the cost of fertilizers, it will not pay to let the ground lie idle to reinvigorate itself for the coming crop. With high-priced labor to hire and manure to be bought, land being cheap, the fallow system is surely the cheaper.

I would suggest that 100 acres could be cropped economically in this way: Say two acres for buildings, gardeu, small lawn, etc.; two acres for road; five acres for timber; five acres for apple orchard; one acre for pears and cherries; one acre for peaches—leaving six 14-acre fields, making one for corn, one for oats and potatoes, one for wheat, and one for pasture where land is cheap (it may pay better to soil the stock where land sells high), one to mow and one for grass to fall on the ground as a fertilizer, excepting in years when hay is high. Where the manure is bought and the labor hired there is not much profit on a field of corn at ordinary prices, with corn 60 cents per bush., and an average crop not over 50 bushels per acre. Corn is now worth 75 cents per bushel for old; but the crop does not average 30 bushels. so that the extra cost per bushel equals the extra price. Everything on the farm ought to be well done to make farming pay.

One object in raising different crops is that less force can keep the work up. In the five-field system the first work in the Spring is to get the potatoes planted and the oats sown; next comes corn planting, which should be done by the time the potatoes are up ready to be "worked." Then the corn is ready to be "worked," and in working corn while young it saves hoeing to plow close, but not deep. A man running his plow or cultivator through the middle of the rows does not earn his board. By the time the potatoes are "finished up" or before, the grass is to be mown and taken care of. Then the wheat claims attention, and by the time it is cared for the oats are ripe, and if the potatoes are early varieties they are ready to be lifted and sent to market. Now the harvest is over, except the corn, apples, cabbage and roots of all kinds. If late cabbages are grown, they should have been set the last of June and have received their share of attention; and cabbage is a good crop for a young apple or other orchard. and may follow very early potatoes or early cabbage.

It is now time to prepare for sowing wheat, thrashing, etc. Where potatoes are raised, no preparation or manure is needed if the potatoes were properly handled. With September comes wheat sowing, corn cutting and apple picking. The latter part of October brings husking corn and finishing up the apples. In November it is proper to prepare for Winter, so that the farmer may have his vacation after nine months of labor that has demanded his attention all the time. In Winter, too, the manure is to be carted, stock to be looked after, and during the short days there can always be found something to do if the farmer wishes to work.

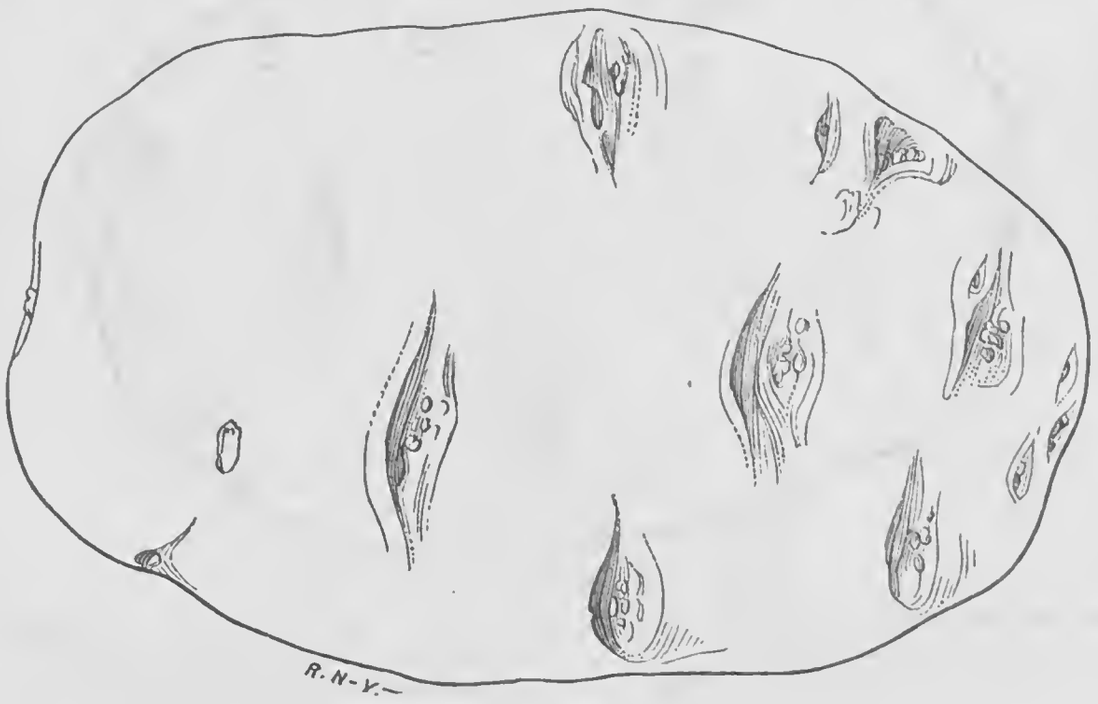
The second object in raising different crops is that if the corn fails the oats may be unusually good, as is the case this year. If the crop is all potatoes, and they rot, the prospect is bad. If half the potato field is under oats, there is something to feed the horses. The third object is that the variety of crops grow better than where corn follows corn and wheat follows wheat. This rule is thought to hold good with most crops, excepting onions.

Mercer Co., N. J. IRA J. BLACKWELL.

Horticultural.

MR. PARNELL'S remarks on hedges remind me that the Osage Orange is quite largely used as a hedge in portions of New Jersey, that I have lately visited, especially in Mercer County, where miles of it may be seen taking the place of the common farm fence. It seems to be very much liked, and will, when properly formed and well kept, turn almost anything, from a hare to an ox. I also noticed many new hedges from one to two years old; but their general management does not seem to be as well understood as it should be. Many of them manifestly received their first clipping when quite four feet high, and they are consequently too open at the bottom. This results from an impatient desire to get a hedge too soon at the expense of its usefulness. For manifest reasons the first year's growth should have been cut back to a foot, and the hedge carried up to the desired hight by degrees. Many of the hedges I saw I would cut down almost to the ground, and form anew. There is too much growth at the top and too little at the bottom. Not a few, however, were well formed, and presented such a delightful contrast to the common rail fence that I cannot help wishing that the usefulness of the Osage Orange as a farm hedge were better and more generally known. The RURAL could hardly do a better thing than give its readers a good practical article on the value and formation of Osage Orange hedges as a substitute for the common unsightly and costly farm fence, especially on the public highway.

I HAVE recently seen a notable instance of the value of thoroughly stirring the soil. On a former occasion I alluded to a new potato digger, and its great fault of bruising the potatoes badly. When this was discovered its use was suspended. It had the merit, however, of thoroughly stirring and pulverizing the soil. The lot was subsequently, at the end of the drought, sown to wheat, and I have seen it several times. On the strip where the pota-



BELLE POTATO.—FROM LIFE.—FIG. 560.

to digger had been used the wheat came up first, grew fastest, and can still be distinguished as far as the eye can see. From this, as it seems to me, a useful lesson may be drawn.

I WISH to say to the lady who presides over the Domestic Department of the RURAL, that I have recently, and for the first time, eaten of tomatoes stewed till somewhat dry, and then served with real cream. The combination was rich and delicious. I hope she will try it and tell her numerous family how she likes it. The cream, as I understood, was added as soon as the tomatoes were taken from the fire.

THE destruction of the cabbage crop by drought and the worms was something melancholy to contemplate; and equally melancholy is the almost universal indifference to the destruction of the worms so largely concerned in the loss of this important crop. I have walked over acres and acres of cabbage during the past month (November), or rather cabbage stumps, on which the worms were fairly piled on top of each other, and no effort whatever had been made for their destruction. It does seem surprising that these pests should be left to increase themselves a thousandfold another year, when a large proportion of them could be so easily destroyed. The stumps could be collected and thrown into the pig-pen or the chicken-yard; many of the worms would be destroyed in the act of doing this, and many more by the pigs and chickens. I induced a friend to throw a barrow load into the poultry yard and the worms were soon consumed; besides, the cabbage is an excellent green food for poultry of all kinds. He is no friend, either to himself or his neighbors, who does not do something to mitigate this terrible infliction. It is still not too late to do something in this way, for all the worms will not have changed to the chrysalis state while the weather continues mild.

THE Variegated-leafed Althæa deserves all the praise that Mr. Parnell bestows upon it. It has been in cultivation a good many years, but, notwithstanding, has not yet become common. It does not propagate kindly, and grows slowly, especially when young, and nurserymen do not generally bother themselves with plants that do not propagate and grow rapidly, for the reason, as many have told me, that it does not pay to do so. This plant is a very slow grower, and is consequently dwarf. In reply to the editor's query I will say that I have not had or seen a perfect flower on it in more than thirty years. There is no beauty in the flower, but there is much in the plant. To prevent disappointment, I will add that a variegated althæa is offered in some catalognes, the variegation, however, such as it is, being in the flower and not on the leaves. Further, my experience and observation coincide with the editor's remark, that the althæa is least enduring in a sandy soil. It is, however, such a fine and useful rub, and generally accommodating, that I ould plant it almost anywhere.

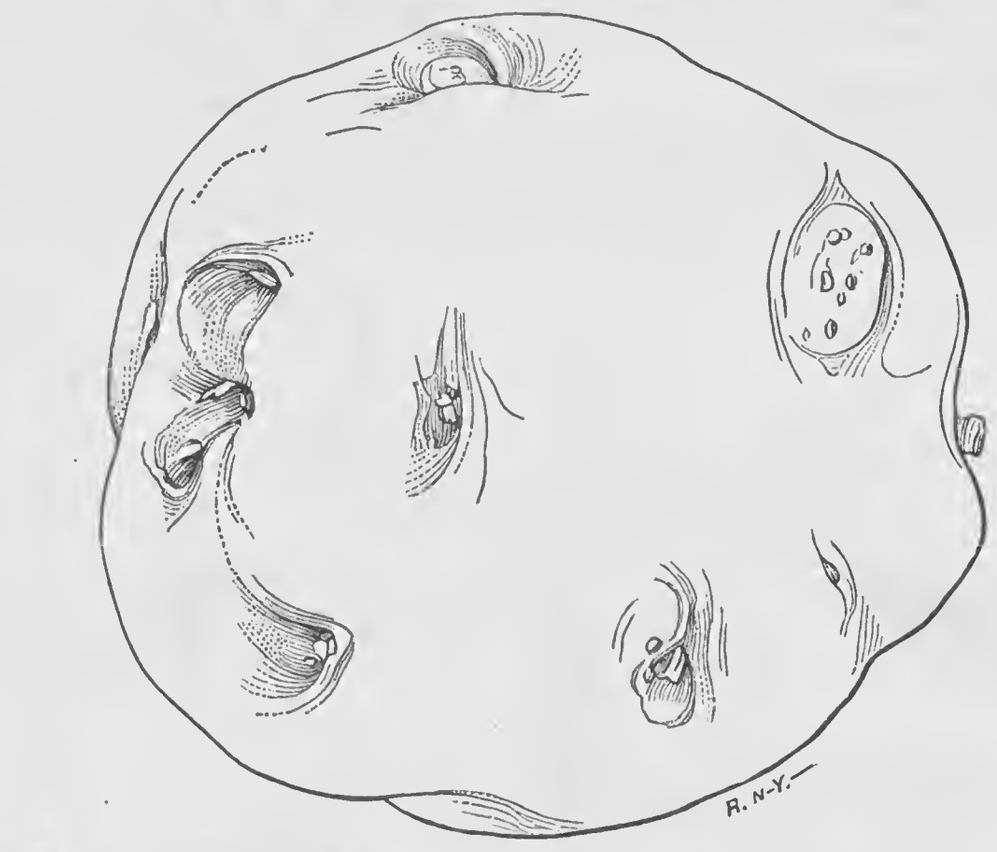
HORTICOLA.

NOTES AND COMMENTS.

A BED of Sweet Alyssum, Koniga maritima is just now (November 12) a perfect mass of bloom, and, as one can well imagine, the fragrance is almost overpowering. Of this charming species we have several very pretty and distinct varieties, viz., Koniga maritima variegata, the leaves of which are prettily and distinctly margined with white and single flowers; double white, with double white flowers, and the new double white with variegated leaves. These varieties are all desirable additions to our collection of greenhouse and bedding plants; but for the window garden, the old single-flowering variety will be found to be the best on account of the ease with which it can be increased, as well as its profuse flowering qualities.

IN reply to Mr. A. B. Allen, who asks for information concerning the Ott pear (see page 771), I would say that my Ott pears commenced to ripen about August 10, and by the 15th they were ripening so rapidly and droping so fast that I gathered them. They ripened so quickly, however, that I could not keep them longer than September 5. Mine have a very thin skin, and as for baking I do not think any one would use them on account of their small size. I do not hesitate to say, however, that Mr. Allen has not got the Ott, but some other sort under that name, as the time of ripening shows it to be distinct from the Ott. I do not think the location has any thing to do with the difference in the time of ripening, but some of the readers of the RURAL may have fruited the Ott and I trust that some of them will give us their experience with it. I will with pleasure send Mr. Allen some cions if he desires them.

THANKS to Mr. Mead for his excellent paper on the cultivation of the Persian Cyclamen. Without desiring to become critical, I desire to offer a few remarks on the Summer treatment of these beautiful plants. After their blooming season is over, I give them water freely until the first of May when I plant them out in a well prepared, shady border, placing the corms about half an inch beneath the surface of the ground. All the attention they require after this is to keep them clear of weeds. No watering is required. They can be taken up



MAGNUM BONUM—FROM LIFE—561.

and potted about the end of August. I give the pots good drainage and also cover the drainage with moss so as to prevent the soil from obstructing it. I also mix a little bone dust with the potting compost. I do not approve of keeping the cyclamen in pots during the Summer season, for the reason that in watering they are apt to be forgotten and sometimes they are given either too much or too little, the result being that the corm becomes injured, and as soon as this happens the plant may as well be thrown away.

LEON, page 773, has very truthfully described the pyracantha as an ornamental shrub for the lawn. I have had no experience with it as a hedge plant, but I have always had the impression that it was perfectly hardy, standing our severe Winters without sustaining any injury. I may also add that the finest ornamental pyracantha hedge that has come under my observation is at the nurseries of the Parsons & Sons Co., at Flushing, L. I. As I have always advised its use as a hedge plant, I should like to hear from Messrs. Parsons concerning its hardiness.

THE editor remarks (page 800) that his crop of celery is the best he ever raised—I wish I could say the same of mine; but, considering the severe drought we have experienced, I do not think that I can complain. I did not give my plants any water. They are rather small in size but of excellent quality.

FOR your explanation of the use of slate and shingles in mulching strawberries, Horticola, please accept many thanks.

CHARLES E. PARNELL.

The Truth and the Whole Truth.

No variety of fruit yet grown is perfect in every respect. Some kinds are very hardy and productive, while the fruit is only passable in quality; others give us fruit of the best flavor, while the quantity is insufficient, etc., etc. With many reports upon new fruits we get only their good qualities, their faults being kept carefully in the background.

As an instance, take most of the reports of the Crescent Strawberry. This variety is generally reported as a rampant grower, a profuse bearer, the fruit shipping well, etc., etc. The above conclusions I cordially indorse, but it is not all of the story. It is a pistillate, and must be fertilized with some other variety. This is not, however, a very serious objection. The great fault with this variety is its poor quality. I know of no other kind so poor in flavor. Still it is a "strawberry," and will probably sell for a few years at least, but I anticipate that it will finally be rejected by buyers. Already a few of our city dealers refuse it. People who have been complaining of the poor quality of the Wilson will hardly accept the Crescent as a substitute.

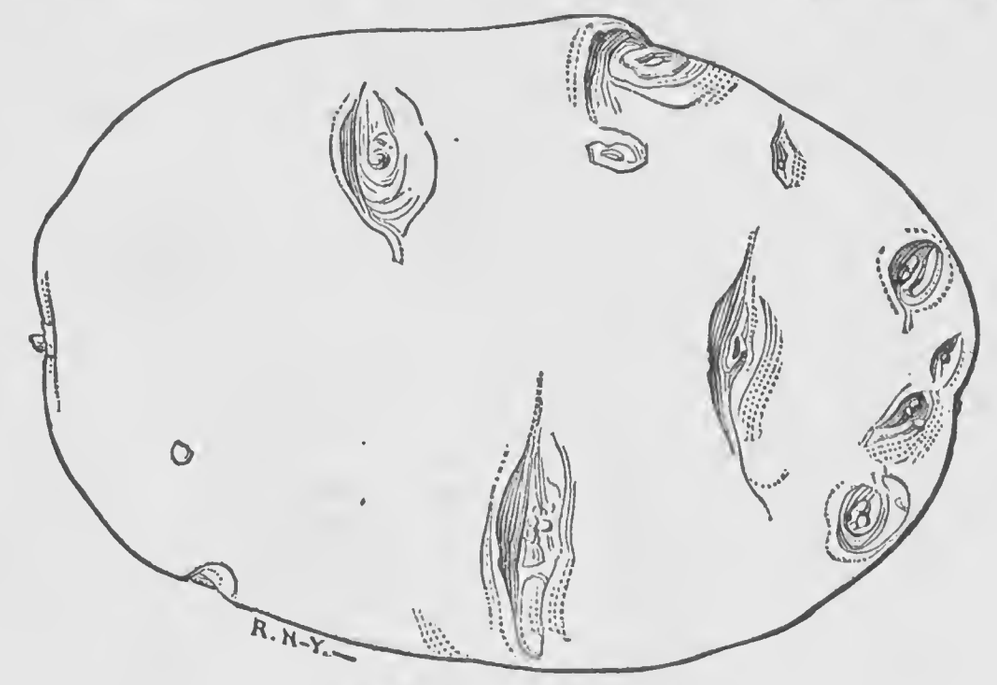
While we are describing fruits, it is best to give all the facts, then those persons thinking of purchasing can govern themselves accordingly. While no kind of fruit is in all respects perfect, there are particular faults that are insurmountable. For instance, a grape that drops from the stem, be it ever so desirable in other respects, will never do for a market grape. A grape that is subject to mildew (like the Iona on my grounds) is worthless. Several kinds of pears that are the most subject to blight should not be planted. I have a decided preference for varieties of fruit that are hardy and good bearers, if the fruit is of fair quality. Give us all the facts, so that of all evils we can choose the least.

NELSON RITTER.

Asparagus Culture.

The frequent recurrence of the asparagus question in the columns of the RURAL is evidence not only of the importance of the subject itself but of the practical usefulness of the journal and the attend-to-your-own-business habits of its readers. There is one phase of the subject which I do not remember to have seen discussed, viz. should we allow asparagus to bear seed? Does the law of "bear fruit and die" apply to it as to some other plants? Too much cutting is exhaustive and would ultimately kill the plant, hence we cease cutting and allow it to put forth its recuperative energies. It is held by some that even florescence is exhaustive and still more is seed-bearing. I can afford—for the sake of my bees—to let mine blossom, but I am not so sure as to allowing it to seed. There seems to be no law that I have observed governing the seed-bearing effort of the plant. Sometimes a very strong stem, and again a very weak one seeds. Will some of the RURAL family respond?

G. W. THOMPSON.



ANDREWS' WHITE—FROM LIFE—FIG. 562.

[Seed or fruit-bearing unquestionably exhausts the plant and weakens the root. If the flowers of asparagus could be removed without more tronble than their removal would be worth to the plant it would be desirable to do so. Such is not the case, however.—EDS.]

Watering Sweet Peas.

Leon's note on his neighbor's sweet peas expresses a donbt whether their luxuriant and lasting condition is due to deep planting of the seed or mainly to rich soil, watering and the suppression of seed pods. I have usually planted early and deep—four inches, which is deep enough in all conscience for my heavy soil—but I never knew what sweet peas were capable of, or saw the admirable and continuous display they can make, until last year, when, having some growing near a copiously watered oleander, they grew grander and grander until frost interfered. This dry season they collapsed until I irrigated by leading in the waste water out of a street rill. That soon restored them, and late in September they were glorions. Who can tell what the perennial peas require? They are still finer to the eye, but don't live long with me. W. G. W.

Tyrone, Pa.

The Vineyard.

MR. MARVIN'S GRAPES AT BOSTON.

I WOULD like to add a few words to Mr. Marvin's remarks, in the RURAL of November, about his new grapes exhibited at Boston at the late meeting of the American Pomological Society. I was much interested in these seedlings, and regard them as a decided advance in the way of improvement of our pure native American varieties. These grapes were exhibited with specimens of the foliage of each variety; and although the appearance and quality of some of the grapes might have led to a suspicion of foreign parentage, the foliage certainly indicated that they were of unmixed, native origin. The following notes were made at the time, of my impression of the different varieties as they appeared September 15, and I shall test these grapes with much interest as soon as they are offered for sale.

CENTENNIAL.—Large, long, pointed, medium, compact clusters; color, pink; berries small; seeds large; skin thin but tenacious; not quite ripe, but pure-flavored and promising to be quite good when fully matured.

CORPORAL.—Medium, rather loose cluster; berries of medium size, black; pulp, tender, pure-flavored and good; not foxy.

RUTLAND.—Very handsome, compact, medium-sized cluster; berries of medium size, black, rich, vinous and pure-flavored. Good. Foliage thick, tomentose, apparently perfectly healthy. A promising grape.

SHARON.—Of Southern Æstivalis type. Dark red or chestnut color. Appears to be quite early. Quality fair; with a peculiar aromatic flavor.

LAURA.—Northern Æstivalis type. Small, compact clusters, not shouldered. Peculiar, high-flavored, sweet, rich and good. Foliage large, thick. Apparently very healthy.

WATERTOWN.—Rather small cluster; white or light greenish-yellow; sprightly, pure-flavored and good. To my taste the best of the collection; skin quite thin but tenacious; and will probably bear carriage well. Leaf large, thick and healthy, somewhat resembling that of Hartford. A promising grape.

I think much credit is due Mr. Marvin for his experiments; and his success is certainly very gratifying in the way of improvement of the native American grapes. The foliage of all appeared strong and healthy, and I regard them all as decidedly better in character and flavor than the Concord. Successive seedlings, or careful crossing of these varieties with our best natives may be productive of the most important and valuable results.

Delaware, O. G. W. CAMPBELL.

Grape Notes, Etc.

The number of feminine names given to Miner's seedling grapes (p. 795) is an example of the general disposition to attribute female characteristics to the clinging and dependent vine. There is a fitness in this, which is so generally perceived that from the times when we first had Isabellas and Dianas to our latest days of Marthas, Ladies, Marys, Adelines, and Antoinettes, the majority of our grapes get their names out of the woman's list, and the number of new sorts is so great as to make it quite likely that the list will not prove long enough.

It is a pity that the Iona is refractory upon the Rural Grounds. In heavy clay soil and warm exposure here, by the Juniata, its quality and productiveness, year after year,

are all that Mr. Green described them to be on page 762. It is one of the very handsomest in form of bunch and color, and is an excellent keeper, retaining the vivacious sprightliness of its abundant juice well on till Christmas. It rotted badly one year. This year I used paper bags, and most of the bunches remain in them yet (Nov. 25) on trays indoors, their bloom and plumpness quite intact. I prune and lay the vines down in November, as with most other kinds. W. G. W.

A New Feature in our Native Grapes.

It has been thought doubtful if a raisin grape could be developed from any of our native classes, but judging from a seedling of V. Æstivalis origin (fruiting the first time this season), this object can be brought about. I have the size of berry and to all appearances the pulpiness necessary to attain this desired object. The pulp adheres to the skin, instead of to the seeds, as it should, and there is generally but one seed, the grape differing from all other native varieties in this particular, and it is of the right color. S. S. MARVIN.

Floricultural.

CASSIAS.

WE are all familiar with the little sensitive or partridge pea that grows so abundantly in dry and sandy lands in the Atlantic States, especially from New York southwards. It is an annual with bright yellow flowers, about a foot or more high, and, although a weed, very pretty in late Summer. There are other common species, as the small sensitive pea of the East and South and the Styptic-weed of the West, and handsomer and more important than either of these is the Wild Senna(C. Marilandica), a perennial plant common in the North. It is often grown as a garden plant, but in the face of Japanese and Plantain Lilies, Seibold's Sedum, larkspurs, evening primroses, perennial peas, golden columbines, and other flowers that are in season at the same time as it, it is hardly worth cultivating.

Among green-house or tender cassias are some highly decorative kinds, and none more so than C. corymbosa, from Brazil. This makes a large bush or shrub, which in September becomes a mass of bright yellow blossoms; indeed, in its season it is one of the most conspicuous plants in our garden. Plants one year old blossom freely. Propagate by seeds or cuttings of the young wood. Before sowing we steep the seeds in hot water. In May we set out our plants in the garden, where they soon take root and grow vigorously. They like rich soil and a warm, open, sunny place, and some good soakings of water in prolonged dry weather. About the end of September or early in October, rather than get them injured by frost, we lift them, cut them back a deal and pot them. We winter them in a greenhouse, but they would survive well enough in a tight, frost-proof cellar, providing they are never allowed to get dry. If, instead of planting them out in Summer, the pots containing them are plunged out-of-doors and lifted up and set back again once or twice during the Summer, to check the roots escaping from the bottom of the pots, they may be brought under cover before frost overtakes them, without being shortened back, and thus their flowering period may be prolonged and seeds ripened if required.

Cassias are of great economic value. The medicine known as senna leaves is obtained from some of the exotic species, and consists of the leaflets. In commerce they are distinguished by the name of the port or country from which they are exported, and the different kinds are readily known by the shape of their leaves. The Egyptian or Alexandrian senna is Cassia acutifolia, and the East Indian, C. elongata. These two are considered the best. Our own wild senna has similar medicinal properties.

Cassia Marilandica grows everywhere in the low grounds of the Rural Farm, and during its season of bloom is very showy among the wild flowers of July. From one of these our very accurate drawing was made.

Miscellaneous.

CATALOGUES, ETC.

THE KLEJ GRANGE.—The name represents a tract of land of about 5,000 acres in Worcester County, Md., within 10 hours, by rail, of New York. The plan of the colony originated with Rev. John Dooly, 134 Bowery, New York City, and he has interested a gentleman of means in it to such a degree that he has bought the tract, made some good improvements, and hopes by selling it cheaply to benefit many families. Persons in search of homes wishing to visit the Grange, can go by steamer at half rate. Address for information Rev. John Dooly, 134 Bowery, New York City.

THE COTTON GOODS TRADE OF THE WORLD.—This pamphlet of 382 pages consists of reports from Consuls of the United States on the trade in cotton yarns and twist and cotton manufactures in their several districts, with an introductory letter by the Secretary of State. It is valuable to those especially interested in cotton products for its statistical information.

PEDIGREES OF SHORT-HORN CATTLE owned by Richard Gibson, Ilderton, Ontario, Canada. These cattle were imported in November, and will be sold at Chicago next Spring.

PROGRAMME of 24th annual meeting of the

WILD SENNA—FROM LIFE—FIG. 563.

Missouri Horticultural Society, to be held December 20-22, 1881, at the Missouri Agricultural College, Columbia, Mo., S. M. Tracy, Secretary.

VICK'S (Rochester, N. Y.) FLORAL GUIDE for 1882. This is one of the handsomest Seed Catalogues ever published. It is profusely illustrated with fine wood cuts and two colored plates. Mr. Vick is early with his catalogue. We usually begin to receive them not until the New Year. All should send for it. The price (ten cents) is less than one-quarter of its cost.

REPORT OF THE UNITED STATES ENTOMOLOGIST to the Department of Agriculture for 1880. By J. Henry Comstock. Illustrated.

CATALOGUE OF POLLED ANGUS AND ABERDEEN CATTLE AND TROTTING HORSES. The property of F. B. Redfield, Batavia, N. Y.

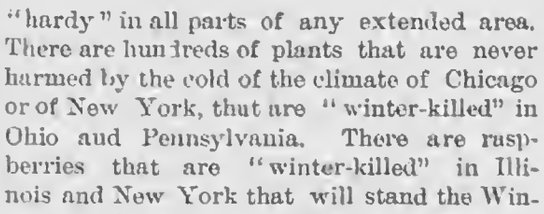
SPECIAL REPORT No. 38 Department of Agriculture upon condition of crops.

RURAL BRIEFLETS.

ALL farm journals unite in advising that the leaves be gathered to use in the pig-pen, cow-yard or stable or composted with other material. As an absorbent of liquid manure, such advise is no doubt good where there is not a plenty of other material which answers the same purpose already at hand. That writers should be of the opinion that it pays to collect leaves to be rotted into soil and at the same time reject muck as of little value seems inconsistent. It would probably require a good-sized load of leaves to make a good-sized shovelful of muck. But is the soil resulting from decayed leaves essentially the same as muck?.....

IT is a matter to be jubilant over that the agricultural press shows signs of strength and prosperity rarely seen in years agone. Some journals promise an enlargement for 1882 during the busy portions of the year at least—one has raised its price and all promise better papers than heretofore. We hope their prosperity may continue and that they will be enabled to fulfill their promises without sacrifice. For ourselves, we prefer not to make promises. Then if we should improve the RURAL, our readers will feel the more pleased; while, if we fail to do so, there will be no disappointment.....

OF all the words used in horticulture and agriculture the word "hardy" is the most misleading. The word is generally accepted as meaning that a given plant will endure the climate, soil and situation of a given section; whereas there is not one plant on the face of the earth that can be said in this sense to be "hardy" in all parts of any extended area. There are hundreds of plants that are never harmed by the cold of the climate of Chicago or of New York, that are "winter-killed" in Ohio and Pennsylvania. There are raspberries that are "winter-killed" in Illinois and New York that will stand the Winters of Canada. The injurious effects of the Summer upon certain plants, which are not apparent until the ensuing Spring, are often attributed to the cold of Winter. So also many plants which are injured or killed by the sharp changes of early Spring are supposed to have been affected by the Winter. Even upon restricted areas, as, for instance, the acre home grounds, it will often be found that in one part a plant is hardy; in another tender. We are first to ascertain whether a given plant can endure the cold of a given climate and then to ascertain whether it requires more or less sun; a sandy, clayey, dry or moist soil; shelter or exposure. And even when all this has been ascertained, exceptional seasons will sometimes reverse the conditions we had hoped to supply. Whenever a plant from an unsuitable soil or situation is restricted in its season of growth, that plant must in some way suffer. But as the damage is not apparent until it has passed through the trying seasons of Winter and Spring, the remote causes thereof are lost sight of while the severity of Winter is alone held accountable.....



DR. VOELCKER does not entirely agree in the statement that the best butter is made from slightly soured cream. As a matter of fact, he knew that good butter can be made from slightly soured cream; but nevertheless, he maintains that the best and finest-flavored butter is made from sweet cream. Indeed, the sweeter the cream the more delicate the flavor of the butter. He does not deny that butter made from slightly acid cream may keep better than butter made from perfectly sweet cream. Sweet cream should be consumed at once; and perhaps this is a difficult question. But if one has a local market for fresh butter, he says, don't let the cream get sour, but churn it fresh and sell the butter as fresh butter at a high price. In point of delicacy of flavor, there can be no doubt that it is better than butter made from sour cream.

AGAIN Dr. Voelcker remarks that in some milk which came from Holland he found, not boracic acid, but salicylic acid. This acid is largely used on the Continent as a preservative of milk, and he believes also of fish and meat intended to be kept fresh for weeks. It certainly does preserve milk, but at the same time it is used as a most powerful remedy in cases of acute rheumatism. A member of his family took it when suffering from that complaint, and it certainly had the effect of temporally alleviating rheumatic pains. Unfortunately salicylic acid is apt to take away the appetite, and to cause deafness and singing in the ears. Now as this acid has such an effect on full-grown human beings, it must have—though perhaps in minor degree—an injurious effect when used in very minute quantities on the constitutions of infants; and it is certainly very objectionable to introduce into milk a material which has such powerful medicinal properties as salicylic acid certainly has.

WE make a few extracts from a very interesting address delivered before the Elmira Farmers' Club by the Hon. H. H. Rockwell as reported in the Husbandman. He has passed several weeks during the past Summer in Utah and Iduho. One evil which he found everywhere existing, and to a much greater extent in the West than in the East, was the propensity of the farmers to run in debt, and put themselves in the power of usurers and capitalists, and the consequent tendency to the concentration of farms, whether for wheat or corn or cattle-raising, into larger and larger estates. . . . . Leaving aside the great wheat farms of the Grandins, Dalrymples and others, and taking the average farmer of the West with from eighty to three hundred and twenty acres of prairie land, he was of the opinion that, as compared with the "side-hill" farmers of his own section, the average of comfort and prosperity is with the latter. The Western farmer, with his rich land, raises larger crops and handles more money than his brother in the East, but he uses too much expensive machinery; he pays too high prices for labor and for building and fencing material. He is careless and wasteful. What he wastes of grain would make a fair crop for some of our farmers. His house is poor and barns poorer. He does not raise a variety of crops or of fruits. The country is monotonous, marked up with section roads like a checker board. The railroads fix the prices of his crops so as to leave him just enough for a living and to pay interest and taxes. . . . . The time for making fortunes by individuals with small capital in sheep and cattle raising has, he thinks, passed. Consolidated capital is monopolizing the business.

KEEPING BUTTER.—Brining butter is a very usual process, remarks the agricultural editor of the N. Y. World. In this plan rolls of butter in canvas wrappers are packed in jars or tubs containing brine. In the report of the Vermont Dairymen's Association Mr. X. A. Willard stated that he knew from actual experience that good butter put up after the following directions will keep in sound condition one year: Use for a package a tub somewhat tapering, with heavy staves and heads provided at both ends, so as to make a package that will not leak. In packing the tub is turned on the small end and a sack of cotton cloth is made to fit the tub, and into this the butter is packed until it reaches to within an inch of the groove for holding the upper head. A cloth is next laid upon the top of the butter and the edges of the sack brought over this and neatly pressed down; then the head is put in its place and the hoops driven home. The package is now turned upon the large end and the sack of butter drops down, leaving a space on the sides and top. Strong brine is then poured through a hole in the small end until it will float the butter. The hole is tightly corked, and the butter is pretty effectually excluded from the air. Where only a small quantity of butter is to be preserved, L. B. Arnold advises packing it in self-sealing fruit-jars. By this plan a little brine is put into the jar, which is then packed not quite full of granulated butter. Some bleached muslin is laid over the butter, then the little space above filled with salt, and finally enough strong brine, made from butter-salt, poured in to fill the can. Mr. Willard advises when packing roll butter in jars that the brine be made strong enough to bear an egg. To three gallons of this brine he suggests adding a quarter of a pound of white sugar and one tablespoonful of saltpeter. Boil the brine, and when it is cool strain carefully. Make the butter into rolls and wrap each roll separately in white muslin cloth. Pack the jar full, weight the butter down and submerge in brine.

MR. CHARLES A. GREEN (in the N. Y. Tribune) states that he has discovered that by the use of strong manilla bags grapes may be kept on the vines in splendid condition long after the season for grapes out-of-doors has gone by. Passing through his vines on October 31, three weeks after the frosts compelled him to gather the crop, and after the leaves had all fallen, he found a few clusters protected by bags that had been overlooked, beneath the leaves. The Brighton opened as fresh, bright and beautiful as he had ever seen it, with bloom undisturbed, the color dark rich maroon. He never ate such rar specimens of this fine grape, and yet the freezing had been severe. They were the nearest approach to a raisin he ever saw on vines. The juices near the skin had condensed and there was a temptation to chew the skin to secure the rare flavor. It would seem that by the use of such stout paper bags we may keep grapes on the vines several weeks later than otherwise would be possible, and that we may enjoy ripe specimens in this way, from varieties not usually fully matured in this latitude. . . . He says that raspberry plants will endure much more hardship in transit than strawberries. He has sent them by mail to England with perfect success. . . . . Mr. Green scattered a little straw over Lady Washington vines last Winter and they came out safe, while where not protected they were injured. We have already stated our Lady Washington (not protected) wa killed nearly to the ground. It has made a surprising growth the past season.

THE Michigan Farmer says that the "polled" breeds could be used with great advantage on the Western plains to put symmetry and quality into the present style of Texan or Western cattle. It would shorten up their horns, make them better feeders, and the meat would be far superior to what it is at present. It would also enable feeders to put their stock into market in ripe condition fully six months earlier. . . . . The gardeners of Kalamazoo, Mich., have adopted a very different method of raising celery from that of the Eastern gardeners. The Prairie Farmer says there is being more raised from the same land each year, as the gardeners become proficient in raising it, for it is a comparatively new industry for Kalamazoo. Instead of the rows being five or six feet apart, as the books advise, they are raising it successfully three feet apart, and instead of five and six inches apart in the rows, it is raised half that distance, and as close as one's fingers for the last or Winter crop, so double the crop is raised from the same land. . . . . The London Mark Lane Express comments approvingly on the growing feeling in America in favor of polled cattle. It suggests that good results might be obtained by breeding off the horns of native stock—by searing in calfhood, or similar means to start with. There are well-authenticated instances, it says, in which mutilations and injuries have been inherited. . . . . One of the best things in the world to give a horse after he has been driven is a quart of oat-meal stirred in a pail of water It refreshes and strengthens him, relieves his immediate thirst and prepares his stomach for more solid food. So says Joseph Harris, after 20 years' trial of it, as the N. Y. Herald reports.

A WHITE ELEPHANT POTATO.—We find the following in the Boonesville (Va.) Herald: Mr. Ed. J. Hayes planted one potato last Spring, weighing some two ounces, and dug from the fourteen hills planted, one eye in each hill, thirty-five pounds and two ounces. He showed us twelve potatoes of the crop which weighed eleven pounds and a-half. The variety of potato is called the "White Elephaut," and was sent him by the editors of the RURAL NEW-YORKER. We have heard of large yields before, but this should surely take the prize. We did not learn the excellence of this variety, but the yield was certainly enormous. . . . . The farmer that "ran rapidly through his property" wore a red shirt and had his brindle bull behind him. . . . . Said the lecturer: "The roads up these mountains are too steep and rocky for even a donkey to climb; therefore I did not attempt the ascent." . . . . . A Massachusetts farmer who has cultivated an acre of onions this year, reckons that he has crawled twenty-two miles on his hands and knees weeding them. A kneesy way to get a living, but weed rather not adopt it.—Boston Transcript. . . . . Says an exchange: "So much space is to-day given to editorial matter that a large amount of interesting reading is crowded out." The editor is frank, at all events, and should be honored accordingly. . . . . Old Pete's wisest remark: "Ef de descendante ob de rooster what crowed ot Peter was to make a noise ebery time a lie is told dar would be sich a noise in de world dat you couldn't heah de hens cackle. . . . . The man who can see sermons in running brooks is most apt to go after them on Sundays when trout are biting.

Everywhere.

RURAL SPECIAL REPORTS.

Arkansas.

POTEAU, Scott Co., Dec. 3.—We are being blessed with a very mild Winter here thus far. Cattle are in good condition and will require very little feed this Winter. Hogs are so poor that all that are not fed will die. There is generally a mast here every year which keeps hogs in fine condition all Winter, but this year there is none. Prices are about as follows: Corn, $1 per bushel, wheat, $2; oats, 60c: flonr, $3.50 per cwt.; pork, 6 to 8c; beef, 3½ to 4c; cotton, 10½c. H. C. B.

Canada.

QUEBEC, P. Q., Dec. 9.—I was much pleased with the dianthus and Chinese pinks, and had some very fine varieties. I expect the carnations to do well next Summer. I regret that the White Elephant Potato did not do well. The bugs were too many for it. My whole crop of potatoes was a total failure. W. M. M.

Dakota.

SWAN LAKE, Turner Co., Dec. 5.—The Washington Oats rusted and lodged; did not do as well as the White Belgian in the same field. The flower seeds I gave away. The asparagus did splendidly. The Rural Branching Sorghum made a most astonishing growth In locations where fodder is an object it must be a most desirable acquisition, but native grasses fill the bill here. H. L.

Illinois.

BAILEYVILLE, Ogle Co., Dec. 5.—The drought ended here about the 10th of September; since then wet weather has prevailed most of the time; pleasant now, and some are plowing. Roads are muddy. Corn husking began about the middle of October and is nearly finished; the yield varies greatly, but is below an average, though better than appearances indicated during the drought. Most of the corn that was planted early and well cultivated produced well, the late and weedy was light both in yield and quality—a lesson worth remembering. Early potatoes also did better than the late ones. My Beauty of Hebron potatoes did well—better than the Early Rose; my Peachblows (late) were small and scarce. Some late potatoes failed entirely in this section. My White Elephant Potato was cut into 16 pieces, with one eye each, and planted carefully May 13; yield fair of medium-sized tubers, but not so great as some of your correspondents have reported; will plant them next season, as I have enough seed now to test them fairly. Fall seeding begun the middle of September and lasted till in October. A large acreage of rye was sown, but only a small amount of Winter wheat. These crops have a very promising appearance now. Pasturage has been very good this Fall since the rains set in, and farm animals are entering Winter in fine condition. I have heard of no serious complaints of disease among stock this Fall, except that a few cattle have died, after being turned into the corn-stalk fields, from eating too much corn and husks. Thrashing has been prolonged on account of the wet weather, and some damage has resulted to grain in stack, but it is about all thrashed now. The Winter wheat nearly all failed and Spring wheat was light; rye a fair yield but small acreage; barley an average yield but discolored; oats varied greatly, but were mostly light; some fields were entirely destroyed by Army-worms. Business has been, and is yet, brisk; prices fair; wages remunerative. Success to the good RURAL NEW-YORKER. Allow me thus early to wish you and your hosts of readers a Merry Christmas and Happy New Year. W. B. D.

SPRINGFIELD, Sangamon Co., Dec. 5.—The seeds I received from the RURAL NEW-YORKER last Spring came in good order, and all grew nicely, but owing to the drought they did not do well except the asparagus, which did very finely and made good plants. The White Elephant and Rural Branching Sorghum did poorly, but I will give them another trial next season. I prize the RURAL NEW-YORKER very highly. W. H. L.

Indiana.

LEESBURG, Kosciusko Co., Dec. 5.—My White Elephant Potato I cut into seven pieces one eye to the piece, planted in good, sandy soil in May and dug in September half a bushel of very nice tubers. My Washington Oats did well; so did the pinks. The sorghum did all that was claimed for it; plenty of seeds got ripe. T. J. W.

Iowa.

STANWOOD, Cedar Co., Dec. 5.—The method that seems to me best for the West at present is to feed out hay under cover to unconfined cattle, allowing the manure to lie in the shed where it is made until the following Fall; then spread it on clover sod or stubble ground and plow it under as soon after spreading as possible. Land thus treated is to be planted in corn the next Spring. I see that some Eastern farmers do not plow their sod in the Fall, but wait till Spring. My method is to sow only clover; cut it one season for hay—sometimes two cuttings, generally but one—then plow in the Fall. This plan gives me winter forage for my cattle and is of great benefit to the ground. My rotation is three or four crops of corn; a crop of oats; clover one crop, and three of corn again; manure on clover sod before planting. W. T. R.

Kansas.

EDGERTON, Johnson Co., Dec. 5.—This has been a very poor crop year in this part of Kansas; corn not more than half a crop; wheat not half a crop; oats good; early potatoes fair; late ones, not half a crop. I planted my White Elephant on April 25, cut to 13 eyes, one eye to the hill. Only nine came up; they grew finely but the drought dried the vines up in August. I dug them in September and got 30 good-sized tubers and several small ones. The Washington Oats I planted with great care on good land I put them a good way from the house lest the chickens should destroy them, and they came up nicely but the rabbits eat them off as fast as they grew and only two heads ripened. The asparagus I planted in April; it came up and grew well; there are two long rows of it nearly two feet high. I can see no difference as yet between the two kinds. The pinks grew well; but they were put on low ground and there came a heavy rain soon after they came up which washed a layer of dirt on them two inches deep; I saved two which were very double and beautiful. The Rural Branching Sorghum I planted in May; it grew about six feet high branching wonderfully; but it never headed out. A year ago last Spring, I got three pounds of Beauty of Hebron potatoes for which I paid $1. From these three pounds, cut to one eye, I raised a little more than six bushels of as nice tubers as I ever saw. Wheat is worth $1.20 per bushel; oats, 40c; corn, 57c; butter, 25; eggs, 20c; potatoes, $1; apples, $1. J. C. B.

Minnesota.

MANSFIELD, Freeborn Co., Dec. 5.—I planted the White Elephant Potato May 10, on new land. It was cut to seven eyes and all did well. I dug them on October 15, and got 50 pounds of good sized tubers; some of them weighed 2½ pounds apiece. H. T.

New York.

WESTHAMPTON, Suffolk Co., Dec. 5.—The asparagus grew finely. Of the Rural Branching Sorghum there was a large growth of stalks, but no seed. A hard frost on the night of October 5 killed it; it was just beginning to blossom. I do not like it, because, first, one has to wait too long for the ground to get warm enough for the seed to come up; secondly, one has to plant more seed than is needed, so that it has to be thinned to one stalk in a place; third, it takes too much work to keep the weeds out before the plants get started, as they start very slowly. I have tried every kind of corn I could get, and I believe the chicken or pop corn—some call it rice corn—is the best for fodder. The stalks are tall and small, and have more and larger leaves than any other corn that I have tried. I believe fodder corn is best for feed or ensilage when it has the most sugar in it. I think it is put in the silo too soon, if it will keep as well if stored when nearer maturity, as there would be more sugar in the stalk. My calves would eat the pop-corn fodder better than the sorghum. People I have advised to try the pop corn this season say it is the best they ever saw for fodder. When the sorghum is in blossom the stalk gets hard and flinty. I think that I should plant the rows three feet apart and from a foot to a foot-and-a-half in the rows, eight to twelve kernels in the hill, and use plenty of manure, and some in the hill or drill. Try it. N. C. J.

Pennsylvania.

RAMY, Clearfield Co., Dec. 6.—My luck with the RURAL seeds is not very flattering in comparison with the results reported from other places; but I would not take the price of the RURAL to-day for my White Elephant Potatoes and asparagus. The potato I received weighed 1⅛ ounce and had nine eyes, which I planted in three hills about the middle of May. Eight pieces grew and, between bugs, frost and drought, they had a hard time of it; but by picking bugs, covering the plant against frost and watering them against drought, I had six pounds of tubers—eight large and twelve small ones. The asparagus has done well; I believe every seed grew and made a growth of a foot. The sorghum grew about four feet, when the drought set in and water got scarce and we let it go in order to have water for more valuable crops; it dried up where it stood. The Washington Oats grew 4½ feet, smutted badly, and when in the milk the blue birds went for them and took every grain. C. C. B.

Virginia.

DISPUTANTA, Prince George Co., Dec. 4.—I am so well pleased with the RURAL that I expect to renew annually as long as I can raise $2. We have had short crops in this section; peanuts about half a crop; cotton, two-thirds; corn, three-fourths of an average crop. We have not had rain enough yet to start the country mills. Wheat and Winter oats are looking well. Quite warm for the season. Many good wishes for the continued prosperity of the RURAL. G. W. P.

Wisconsin.

SPAFFORD, Lafayette Co., Dec. 4.—The season with us has been a favorable one compared with the experience of many others throughout the country. Our Spring was late, the snow lying on the ground late in April, but it left under the influences of mild weather and warm suns. Our last frost was on May 3 and the first frost on October 5. Corn a fair crop, except on low, flat lands, where, on account of frequent rains, it could not be worked. Oats an average yield. Very little wheat or barley was sown, as the chinch bug is very destructive to them. Prices have been very good; live hogs have sold as high as $6.30 to $6.40 per 100 lbs.; oats, 40c. per bushel; butter, 30c. to 44½c. per lb. The Rural seeds have done very fairly. The White Elephant Potato I cut into 12 pieces with an eye in each, and planted in 12 hills; 11 grew and yielded an even half bushel of tubers. We had a dry and hot spell that ripened them off prematurely or I think there would have been a larger crop. I used no manure and gave them two hoeings, just to keep the weeds down. The Rural Branching Sorghum I planted the last day of May, putting four or five seeds in a hill; they came up readily, but only one in a hill, except that in two hills there were two plants, and there were from five to 10 or 12 stalks to a hill. No manure was used, except a handful of ashes thrown around each hill. I planted one row on very poor ground, another on better; that on the poor ground was from five to six feet high; that on good ground, eight feet high. I cut two hills near the ground; one put out 19, the other 20 sprouts. I was experimenting with it. The Washington Oats grew well; no smut. The flower seeds I divided into four parcels and gave to as many lady friends, who are well pleased with them. The asparagus seeds have done well, many of the plants having put up a second set of sprouts. I am well satisfied with the seeds, and also with the paper. W. S.

The Queries.

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention.]

ACTION OF A SIPHON, ETC.

F. L. L., Smithfield, Va., asks, 1, what is the motive power in a siphon; will it draw water from a well in which the water varies from eight to twelve feet from the top.

ANS.—1. The pressure of the atmosphere, which amounts to about 15 pounds to the square inch at the level of the sea, when water boils at 212 degrees. Under such conditions the atmospheric pressure is capable of sustaining a column of water 33.8 feet high. The siphon acts on the principle that the flow will be in the direction of the leg which contains the greatest vertical hight of liquid. It will act only when the bend at the top is not higher above the level of the water in the reservoir than the column of liquid which the atmospheric pressure at the locality is capable of sustaining. For water this could be only a trifle over 33 feet at the sea level, and less than 20 feet at a hight of 15,700 feet, for the higher one goes the less is the pressure of the superincumbent atmosphere. In practice the outer or discharge leg is usually longer than the one immersed in the liquid; but the only requirement is that the discharging orifice shall be lower than the level of the liquid. The air in the siphon must be exhausted before it operates so as to allow the pressure of the atmosphere on the surface of the reservoir to act as a motive power in raising the water into the siphon from which the counter-balancing atmospheric pressure has thus been removed. For this purpose it is convenient to have a pump attached to the outer leg of the siphon, the lower orifice of that leg being closed while the action of the pump is producing exhaustion.

THE PIOSCOPE.

M., Polo, Ill., referring to the description and cut of the Pioscope milk tester lately published in the RURAL, supposes that a "close-fitting cap covers the central cavity like a ball and socket, as it were," and that when the milk is put in the cavity the ball presses out all but a thin film, so that the more milk left in the cavity, the lighter-colored will the black vulcanite appear through it; and he objects that if the "ball" is not made uniformly close-fitting, through bad material or workmanship, the film of milk will be either

thick or thin to show the proper quality of the milk tested. He also objects that it would require very keen eyesight to distinguish the shades indicative of different grades.

ANS.—The description given of the Pioscope should be sufficient to prevent any such mistake regarding a ball. The vulcanite plate has a shallow cell about one-fortieth of an inch in depth. The glass cover laid over this presses out all the milk but the thin film that lies under it in this shallow cell, and the black substance of the vulcanite, of course, shows through the milk in proportion to its density or depth of color and richness in cream. There is no difficulty about the shades of color. Any eye that can distinguish the color of a lemon from that of an orange can distinguish the shades of color in the milk. The instrument is very cheap, and, so far as the writer has experimented with it, it is as accurate a test of the quality of milk as can well be devised.

SMUT IN THE WASHINGTON OATS.

R. C., Ontario, Canada, asks whether the large amount of smut in the Washington Oats was due to faulty seed; and how to avoid it in the next oat crop raised from the seed saved from the RURAL'S Free Seed Distribution.

ANS.—Close breeding, in plants and animals alike, tends to produce constitutional weakness and an aptness to become affected by diseases of various kinds. It is made worse by high feeding—and manuring is feeding. These oats have been got by selection of seed, which is close breeding, and have doubtless been well manured, which is high feeding. These are the causes of the tendency to smut in them. It is the same with corn, wheat, potatoes, and other plants which gradually weaken and become diseased, and fail in course of time. To remedy it we would steep the seed in a solution of sulphate of copper, four ounces to the gallon of water and use mineral fertilizers only. Lime would be advisable also. This would destroy the smut spores and tend to strengthen the constitution of the plant.

ROUP IN POULTRY.

A Subscriber, Maspeth, N. Y., has some chickens thus affected:—a corner of one of the eyes of each and the roof of the mouth are filled with hard, yellow matter; the eye is closed with scales of the "stuff" which hold the lids together, while a watery substance runs from them. The fowls sit still, moving only when driven.

ANS.—This is a case of roup or malignant catarrh. The cause may be cold or diseased blood from want of ventilation or other insanitary causes. The cure is to wash the eyes with warm water in which a small pinch of sulphate of zinc is dissolved. Do this by injecting the wash with a small syringe. Also wash the mouth and thoroughly cleanse it with the same solution. Then drop a pinch of chlorate of potash down the throat and give the fowls some warm, soft food, bread and milk or corn-meal mush, for a few days. Keep the house perfectly clean and fumigate it with burned sulphur.

Miscellaneous.

J. W. F., Daretown, N. J., says: "What are your prices for Perfection Golden Heartwell Celery and Challenger Lima Bean?"

ANS.—The above is an instance of many similar applications which come to the RURAL NEW-YORKER. The Perfection Heartwell Celery and Challenger Lima Bean are not yet for sale. If they prove superior to other kinds of celery and Lima beans they will, of course, be offered by seedsmen. But the RURAL never sells seeds or plants under any circumstances whatever. We are obliged to make this rule imperative. If we were to *sell* seeds and plants, we should no longer hope to command the confidence of our readers in our professed disinterestedness in the RURAL'S Free Seed Distribution.

O. H., Golden City, Mo., asks what strawberries would be likely to do best there; 2, where can the two cherries, Montmorency Ordinaire and Montmorency Large-fruited, spoken of by Mr. W. C. Barry in the Fair Number, be obtained; 3, what is a good, cheap early potato; 4, the best early field corn.

ANS. 1. It would be mere guesswork for us to give a list of strawberries that would thrive in a given locality. The only way is to procure the best kinds in small lots and *test them.* 2. Of Ellwanger & Barry, Rochester, N. Y., we presume. 3. Beauty of Hebron, Early Rose, Early Ohio, Early Vermont. 4. The eight-rowed yellow flint.

G. W., Ithaca, N. Y., asks how many quarts of raspberries are required to make a pound of dried ones.

ANS.—That depends very much on the condition of the fruit and the manner of drying them. Of Black Caps, if cured in an improved, quick-drying evaporator, the proportion is as follows:—Davidson's Thornless and Mammoth Cluster three-and-a-half quarts; Doolittle and Gregg, three quarts, if picked daily as soon as they turn black. If over-ripe, from three-and-a-half to four quarts will be needed. If the fruit is sun-dried or dried slowly by artificial heat, the juices are all evaporated, and from a pint to a quart more at least will be needed.

A. C. H., Roanoke, Ind., would like to know, 1, where and by whom the Davis Vertical-feed Sewing Machine is for sale; 2, where he can get the Early Ohio Potato for seed; 3, would salt sown next Spring on Winter wheat destroy or drive away the Hessian fly; 4, when and how often must sulphur be dusted on grape-vines to prevent mildew or grape-rot; he has 500 grape-vines but has not had 100 pounds of whole bunches in two years.

ANS.—1. Of the Davis Sewing Machine Co., Watertown, N. Y. 2. Of any seedsman, 3. No. 4. As often as the mildew appears. Other questions will be answered in due time.

J. W. C., Chester, S. C., wishing to test good varieties of wheat in that section, asks us to send small quantities of Clawson, Surprise and other good sorts.

ANS.—Clawson was distributed *free* by the RURAL years ago. Surprise and Fultzo-Clawson will be distributed in our present seed distribution which will be begun in a few weeks. We sell no seeds or plants of any kind—have never sold them and do not ever propose to. The object of the RURAL Free Seed Distributions is to introduce valuable new varieties without cost to the farmer or gardener.

F. M. B., address mislaid, asks whether D. F. Beatty, of Washington, N. J., will fill orders sent to him for pianos; our inquirer sent one in before the late fire at Beatty's factory and the instrument has not yet been forwarded.

ANS.—We referred the matter to Mr. Beatty and he assures us that since the fire he has been exerting himself as hard as possible to "catch up" with orders, and that he will fill every one so soon as he can.

C. W., Shell P. O., W. Va., asks the lowest cash price for the Czar Revolver advertised in our Fair Number, and says he understands we guarantee the weapon to be equal to any made.

ANS.—The RURAL NEW-YORKER sells nothing whatever except papers. We do not guarantee anything.

W. H. M., Beaver Crossing, Neb., asks where can "listing" plows be obtained.

ANS.—B. D. Buford & Co., Rock Island, Ill.

G. C. DeB., Penn, Yan, N. Y., asks for the address of A. W. Livingston, the originator of Livingston's Perfection Tomato.

ANS.—No. 705 Tenth Street, Des Moines, Iowa.

M. V. C., Gibbon, Neb., asks whether there is any periodical treating of veterinary practice.

ANS.—The Veterinary Review, a monthly, price $2 a year, published and edited by Prof. A. F. Liautard, M. D. V. S., 141 West 54th Street, New York, is the only thing of the sort we know of.

E. B. S., Warren, Pa.—Skeletonized leaves are usually made by dissolving the succulent portions by a hot solution of caustic soda and then whitening the skeleton of fibers remaining by bleaching powder—chloride of lime. "Skeletons" may also be prepared by steeping vegetable matter in a mixture of chlorate of potash and dilute nitric acid for several days.

J. M. Allen, Kansas, asks, in the RURAL of Dec. 3, who has Oxfordshire Down sheep for sale, and E. W. M., Verden, Ill., hereby informs him that Cooper, Maddox & Co., Reading, Ohio, have sheep of this breed for sale. Our friend bought a pair last Fall, and believes they are the "coming sheep" for profit both for wool and mutton.

E. C. H., Hobart, Ind., asks whether the "so-called hay loaders are serviceable devices, and if so, which would be of use to farmers.

ANS.—Yes; hay loaders are certainly useful to farmers. Foust's hay loader, made by the Keystone Manufacturing Company, Sterling, Ill., is a practical device highly recommended.

H. R. R., Atlantic, Iowa, asks whether the Right Speedy Corn Sheller is what it claims to be.

ANS.—It is a good cheap sheller, made by a reliable concern.

Mrs. L. M. Hoffman, Madisonville, Ohio, asks where she can obtain Oxford Down sheep.

Send for the **Supplement of the Rural New-Yorker.** *This will be sent to all applicants free of charge. It gives an account of the*

$2,000 Worth of Presents

offered to all subscribers who produce the best yields from our **Free Seed Distribution of 1882.**

The Great Farm and Rural Journal of America.

Fifth Year of its present Management---32nd year of its age.

For the North, South, East, West.

IT KNOWS NO SECTIONAL PREJUDICES.

The first journal to have established an Experiment Farm conducted in the interests of its readers.

The first to have made regular free seed and plant distributions among its subscribers. In this way it is conceded to have introduced many of the most valuable farm and garden plants in cultivation.

The Rural New-Yorker is acknowledged to have worked a NEW ERA in rural journalism, and to have accomplished incalculable good to the agricultural interests of our country.

500 Original Illustrations Annually, Horses, Cattle, Sheep, Swine, Poultry, Milk, Butter, Cheese, Diseases of Animals, Bees, Injurious Insects, Grain, Grass, Small Fruits, all Ornamental and Useful Trees and Shrubs are among the prominent subjects treated in its columns.

THE BEST WRITERS IN THE WORLD.

Everybody who is interested in a garden, vineyard, orchard or farm; in new plants; in farm or garden implements; everybody who is interested in Horticulture and that seeks through such means to increase the happiness of life and home, **should Subscribe.** The Rural New-Yorker is the earnest friend of all who love nature and her works.

The Rural New-Yorker has no other than the true interests of agriculture to subserve. It has neither seeds nor plants nor books nor anything whatever to sell. It is conducted purely in the interests of Agriculture and Horticulture and Stock-Keeping. Its tests of plants, seeds, manures, implements, are made regardless of individual interests or those of advertising patrons. It holds the interests of LAND CULTURE as above all others, and its aim is to benefit all who occupy themselves in the culture of land and its attendant industries, either for pleasure, profit or support.

No matter where you live, you cannot afford to be without the Rural New-Yorker. It is the progressive, aggressive, alert, original, conscientious rural journal of the age. Thousands of testimonials to this effect. Our **Everywhere Reports** are invaluable to the Farmer and Horticulturist. They have proven of great value to them in determining the best time to **Buy** or **Sell.** Our market reports are corrected by a special reporter up to the time of going to press. Our agricultural and general news embraces everything of interest to intelligent readers. Correspondents everywhere. Try it—*Try it*—TRY IT—for one year! It will cost you but $2.00. It may save you hundreds. Try it as a measure of Economy.

The objects of the Experiment Farm of the Rural New-Yorker are to test all kinds of new seeds and to present the results to our readers; to produce new varieties of grain by cross-breeding; to test new farm implements and methods of culture, with a view to producing the greatest yields at the smallest cost; to disseminate among its readers seeds of varieties which, from our own tests, have proven of unusual worth without cost to them, and thus advance the agricultural interests of the whole country. The Rural New-Yorker has no personal interests to subserve.

The most vigorous and able combination of Practical Writers ever collected together in the columns of any Agricultural Journal. Here is a partial list for 1881.

Dr. J. B. Lawes, Rothamsted, England.	Charles Shinn, Cal.
Prof. J. P. Sheldon, Hants. & Wilts. Agl. Col., "	W. C. L. Drew, "

Prof. C. C. Georgeson, Agr'l College, Texas.	Prof. A. E. Blount, Farm Manager Agr'l Col., Col.
	T. H. Hoskins, M. D., Vt.
	Prof. F. A. Gulley, Farm Manager Agr'l Col., Miss.

And not less than 600 others among our subscribers.

THE TRUTH

is that no Progressive farmer, dairyman, stockman, pomologist, florist or gardener **can afford to do without it.**

The Rural New-Yorker earnestly labors to instruct the stockman and breeder; to introduce new fruits of improved quality; to make known the beneficent influences of the garden and of trees and shrubs about the home; to increase the comforts, refinement, health, and the general welfare of all who own and cultivate land. It tests all new vegetables, and makes known their value. It tells how to raise them in the greatest perfection. Shrubs and trees, flowers, plants of every description, the methods of cultivation to suit the varied and ever-changing conditions which arise, constitute prominent departments.

The insect enemies which infest our field crops, which seem to be rapidly increasing, and entomology in general are treated in our columns by the ablest specialists in the country. To aid in

The Progress and Development of American Horticulture and Agriculture

is always our earnest endeavor. Such efforts as these have brought the Rural New-Yorker to the position it now occupies. The Price of the **Rural New-Yorker is $2.00 a Year,** payable *invariably in advance.* We have no club or second price. It is alike to all.

Address **RURAL NEW-YORKER, 34 Park Row, New York.**

THE
RURAL NEW-YORKER,
A National Journal for Country and Suburban Homes,
PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, NEW YORK.

SATURDAY, DEC. 24, 1881.

A merry, merry Christmas to all!

ANNOUNCEMENTS.

THE Bonanza Farm series of articles and illustrations will be begun in our first issue of January, beginning with the portrait of Mr. Oliver Dalrymple and a sketch of his life. The portrait will be printed upon heavy supercalendered paper as a supplement. The second of the series of illustrations will be Breaking; the third Backsetting; the fourth, Seeding; the fifth, Harrowing; the sixth, Harvesting, and the last Thrashing. Mr. Dalryn.ple informed our special correspondents that this is the first time he has ever given comprehensive notes of his methods of farming to the public, and that all other writings upon the subject have been from desultory information, and most of it wide of the truth.

WE take much pleasure in announcing to our readers that the distinguished American horticulturist, Dr. John A. Warder, is preparing a series of articles for the RURAL NEW-YORKER on Forestry. The following subjects will be specially treated:

Water-Supply of a Country—How affected by Forests; Results of Clearing. Torrents; Overflows.

Where to Plant—Preparation of the Land.

Planting—What and How; Massing; Mingling; Grouping.

Cultivation—Protection—Fencing—Fires.

After-Treatment—Thinning, &c.

Felling—Harvesting.

Systems of Management.

Secondary Products—Bark, Pitch, etc.

Conservation or Planting Anew.

Natural Reproduction.

Coppice Wood—Management; Time for Cutting.

Cheap and Hardy Trees—Pioneers for the Prairies.

Soft-Woods—Poplars, Willows, etc.

Catalpas.

Hard-Woods—Oaks, Hickories, Walnuts.

Maples, Ash, Cherry, Elms, Buttonwood, Beeches, Birches, Iron-woods, Alders, Honey-Locust, Ailanthus, Black-Locust, Chestnuts, Magnolias, Tulip-Tree, Sassafras, Sumac, Thorns, Plums, Crabs, Viburnums, Mountain Ash, etc., etc.

Miscellaneous and Novelties from Abroad.

Conifers and Evergreens.

Our Pines; Spruces; Firs; "Cedars;" Larches; Cypresses; Thujas, etc.

Undergrowth—Dogwood, Hazel, etc.

Insects and Enemies.

Local Plantations already started—Larch Dale, Illinois; Messrs. Fay's Estates in Massachusetts; Pine Forests of Cape Cod; Scofield's, Elgin, Illinois; Larch Wood, Iowa; Col. Whiting's, Iowa.

Shelter Belts—Wind-Breaks.

Black-Locust Groves of Ohio.

Dr. Warder's Experiments, etc., etc.

PROFESSOR A. E. BLOUNT will commence early in the New Year a series of articles on Colorado farming, wheat growing, etc.

MR. WALDO F. BROWN, the veteran farmer of Butler County, Ohio, will shortly begin a series of articles in the RURAL NEW-YORKER upon the following topics:

How to Raise Pigs—Illustrated.

How to make Cheap Pork, adapted especially for the corn farms of the West.

Breeds and Crosses.

Recollections of Hog Driving.

MR. HENRY STEWART, as has already been announced, will begin his farm novel, founded on fact, entitled "The Story of Stony Brook Farm," as soon as our present story closes.

THE well-known Professor A. J. Cook begins with the New Year a series of articles on bees and honey. Professor Cook has for 14 years been an earnest student of apiculture, carrying forward for the entire period experiments that had for their object the development of the science and improvement of the art. For the past thirteen years he has been a lecturer on bee-keeping at the Michigan Agricultural College, Superintendent of College Apiary, which has paid from 100 to 500 per cent. on the capital invested; President of the Michigan State and of the National Bee-Keepers' Associations. He is the author of what everywhere is acknowledged as the most complete work on apiculture in the world, and his Manual of the Apiary is thought, both in Europe and America, to be the most complete work extant on this subject.

WHAT ARE WE COMING TO?

A THOUGHTFUL person may well put the above stated conundrum to himself. For indeed the progress of invention and enterprise is such that one stands bewildered when he considers the changes that are daily and hourly occurring. If one should study the records of the patent office, or spend a few hours in the office of a patent lawyer, or rather a lawyer who devotes his attention to the business of procuring patents for inventors, he will speedily come to the conclusion that the two great productive arts of industry in the future will be electricity and chemistry. Hitherto chemists have been analyzing, and now they have taken to synthesis; that is, while heretofore they have been taking things apart and discovering the elements of which they are made, they have now turned their attention to putting these elements together and producing substances from them. They have produced diamonds from carbon; and other gems from their elements; they are making sugar and sirup from C^{12} H^{20} O^{10} by the addition of $2H^2$ O, materials which are abundantly found in nature and by-and-by they may be able to produce these elements without the intervention of the farmer who at present supplies them in the shape of corn, or the lumberer who furnishes them in the form of sawdust. Butter is no longer necessarily the product of the cow, nor, for that matter, of the ox or the pig either, which at present furnish the requisite C. H. O. in the desired proportions.

But even this indirect aid from the farmer may be found unnecessary and the miner may gather from the bowels of the earth what is now scraped from the bowels of animals, and the agriculturist find his occupation gone to this extent. We cannot doubt that science, having conquered this difficulty, will continue to make further discoveries; indeed it has already found a substitute for milk, and as milk is a complete food and mankind could exist comfortably and healthfully upon it without any other nutriment, the only question which now distresses the chemist is how to procure enough of it. This difficulty may vanish in time before enterprize and perseverance. We see an approach to this consummation in the present production of meat. Formerly we waited five to six years for our ox or steer to reach maturity, and now two years are found ample time; and even one-year-old beef was found at Chicago cattle show to be all that could be desired. So that we have already nearly eliminated time as an element in producing beef and that little difficulty, too, may soon be disposed of. All that then remains is the bread question. This may be thought to be a poser. But one Tanner recently showed that it was possible to live 40 days without food, and how many Tanners would be required to show how a man can live for a whole century without nourishment, excepting the chemically combined milk and butter, and, of course, cheese, with sugar and glucose sirup and honey, to help to sweeten the uses of any adversity which might happen, is only a question of figures. But we see no reason for borrowing trouble in regard to this business. It may, after all, be but the approaching period which some persons believe in as the millenium, when all trouble and sorrow and labor will be banished, and all that mankind will be called upon to do will be to enjoy themselves, practice all the virtues and be happy.

AGRICULTURAL COLLEGES.

WE frequently feel indignant when reading the flippant, ignorant, and unjust remarks in undeserved derogation and contempt of Professors of Agricultural Colleges, that are far too commonly made by writers and some editors of so-called agricultural journals. An agricultural college, and, indeed, any other institution intended for the benefit of agriculture, and the gentleman placed in charge of such institutions, are made the butts for weak pleasantries and pitiful sarcasms by persons who are themselves totally incapable for a moment of filling any of the responsible positions in these educational institutions. They are comparatively new, and no precedents exist by which their control and management could be organized and made effective. A new field, like an uncleared farm, was to be occupied and reduced to profitable culture. By untiring and skillful labor an inchoate, if not chaotic condition of affairs has been brought into order and actual work; and several of these institutions have become models of success. The professors deserve the greatest credit for what they have achieved, and for the modest and disinterested manner in which they have worked and surmounted obstacles and difficulties which can be realized by few persons who have not given much thought to the subject of teaching agricultural practice and science. That many farmers may not have sprung, all armed, as it were, for the fray, from these colleges, is no cause for objection; for the truth is, there is such a general demand for agricultural teachers that many of the graduates have been drawn into this useful industry and most of them are doing good service in it. One of the most serious drawbacks which the colleges and the professors have had to contend with, has been the constant carping and unfavorable criticisms to which we have referred. It is a satisfaction to know that this unjust treatment is not now so common as it has been, but still there are persons who lose no opportunity of demanding why the colleges do not do this thing or that thing, and of hinting that the reason is that the professors know nothing about their business. There is no class of useful men that are more deserving of praise for what they have done under much difficulty than the professors of agricultural colleges, and we take pleasure in thus expressing this as our sincere belief based on a knowledge of what they have done and are doing. We know something ourselves of the time and labor required for experimenting and its necessarily slow process, and also how little time can be spared from the arduous work of teaching.

WE find that several seed houses have sent out what they call "Branching Sorghums" since the Rural Branching Sorghum was announced. We have tried them and find that after being cut back their growth is entirely checked or a fresh shoot appears only here and there. Most of them bear *drooping* seed heads. Our readers may accept this one characteristic as positive evidence that the variety is not the Rural Branching Sorghum, as the seed heads of this variety are always upright.

THE RURAL NEW-YORKER of next next week will contain a second article upon ensilage by Dr. J. B. Lawes. It throws a wetter blanket upon the "new dispensation" than did his first. Dr. Lawes in a private note accompanying the article remarks that "although ensilage is perhaps useful for some purposes, it does not merit the extravagant praises which it has received."

BREVITIES.

OF late a great deal of capital is being invested in sheep and cattle raising in Cuba, and the importation of choice sheep, cows and bulls for breeding purposes is largely increasing, no less than 1,000 head having been lately delivered at Cienfuegos alone in a single week.

PROFESSOR BUDD, of the Iowa State College, writes us that his offer to send his pamphlet on forestry has brought out over 100 applications from parties in Dakota and Nebraska who report seeing the notice in the RURAL NEW-YORKER.

"THE RURAL IS NOW THE BEST PAPER." So said Prof. Beal of the Michigan Agricultural College in 1878. Under date of September 25, 1881, he says: "I am willing, in your case, to change the date of the compliment to the present."

WILL our friends, in making application for seeds, kindly state which variety of corn they prefer. The Flint is best suited to the higher latitudes perhaps. When no choice is made we send the variety which, in our opinion, is best adapted to any given locality, but we prefer to have our subscribers designate their choice.

WE have been much pleased with a visit from Mr. R. S. Saunders of the Southern Planter, who has lately bought the Southern Cultivator and Dixie Farmer, which will in future be united with his former paper under the name of the Southern Planter and Farmer, published weekly at Richmond, Va., and the Southern Cultivator at Atlanta, Ga., and under the genial and able management of Mr. Saunders they have a bright prospect of success.

UNTIL the accession of the Gambetta Ministry to power a single Cabinet Minister represented Agriculture and Commerce in the French Government. Gambetta, however, in making up the Cabinet of which he is Premier, assigned to M. Rouvier the portfolio of Commerce alone, intending to press the passage of a law creating two new Cabinet officers—Ministries of Agriculture and Fine Arts. Last Thursday the French Senate voted to create both, and as the Ministry have a larger majority in the lower than in the upper House, there is little doubt that Agriculture will soon have a separate representative in the French Cabinet.

THERE is a good deal of agitation among millers at the West with regard to grading of wheat. Last Wednesday an important meeting was held at Indianapolis composed of the grain dealers of Indiana and representatives of the Millers' Association for the purpose of securing a stricter grading and greater care in buying wheat at the elevators and to prevent loss from having the grades of wheat reduced when it reaches Chicago. On the same day a meeting of the representatives and millers of Minnesota took place at Minneapolis to adopt a system of grading uniform with that at Chicago. It is not at all improbable that a very decided discrimination will soon be made against soft wheats also.

FOREST LEAVES.—Before the ground is covered with snow, the leaves in the wood lots, should be raked up and either brought to the barns and put under cover or left in heaps to be drawn as soon as possible. Now that the leaves are slightly moist from rain, they can be raked and carried with ease. An easy way of handling them is to gather them in a basket made of gunny bagging sown a little loosely around a light hickory hoop pole. A large quantity can be lifted at once in such a basket and turned out into a wagon. Leaves make the best and safest possible litter for brood sows with young litters, and are useful for littering other animals and in the poultry house. The value of leaf mold is well known and leaves used for litter are the raw material of leaf mold and therefore well worth gathering.

Mr. H. I. Kimball, Director-General of the Atlanta Cotton Exposition, announces that the great show will close, without fail, on the evening of December 31, although hundreds of letters are received daily begging the managers to keep it open through January. The last week is expected to be the most interesting and important of the exposition, and we would urge all our friends who have not yet seen this grandest show of the kind ever held anywhere, not to lose this opportunity of seeing it at its best, if they can make the trip without too much inconvenience. Mr. Kimball exultingly proclaims that it has been a magnificent success, which he gratefully attributes more to the untiring and unstinted support of the Press than to all other causes combined. Well, yes, we have certainly done what we thought for the best interests of the country in the matter.

WE learn from Washington that owing to the vast number of encroachments by homesteaders on the public timber lands between Wyoming and Duluth, Minn., the government has sent agents throughout the country to make up cases of trespass. Although urgently in favor of the conservation of our timber lands, still we strongly deprecate the adoption of any harsh measures against the pioneer cultivators on our Western frontier for having used timber from the public lands for buildings and other improvements on their own homesteads. Honest homesteaders have a hard battle to fight in extending the limits of civilization and husbandry and should receive every reasonable indulgence from the general government. While the first settlers endure the greater part of the hardships incident to the opening up of a new country, it is seldom they reap the reward of their labors to the same extent as those who come later. For those who engage in stealing the public timber to sell it, however, we have no more sympathy than for other dishonest depredators.

NEARLY a year ago we spoke here of vast frauds in forging titles to Missouri lands, and told of the arrest of some of the conspirators who had been guilty of the crime. One of them was convicted at St. Louis about a month ago, and is now in the State Penitentiary at Jefferson; two others, William and Addison F. Burns, were tried last week at Clarion, Pa. They were the most extensive dealers in the country in the fraudulent titles by which the Government was swindled out of upwards of $3,000,000, unless it decides to extort from the innocent purchasers of the lands the amount lost in part by its carelessness. The evidence showed that the income of the accused from this dishonest source during the past eight years had been over $800,000. Every means that money and influence could command, from employing the best legal counsel to tampering with the witnesses for the prosecution, was used in favor of the defendants, but both were convicted on every count. The trials of three more of the gang, D. S. Bingham, J. F. Richards, and S. L. Custer, will begin at St. Louis on Dec. 20.

Miscellaneous.

A ROCK GARDEN.

SAMUEL PARSONS, JR.

I NEED hardly ask the reader whether it has ever been his good fortune to light on such a scene as heads these few remarks on the artificial construction of natural scenery. It is sufficient to know that hardly any one not city-bred to an inconceivable degree has failed to come across similar nooks in the course of his Summer rambles. The fact that few realize, however, is that such quaint, broken landscapes can be made, out of whole cloth as it were, by piling rocks and earthand plants together along an otherwise uninteresting stream and hillside. It is true we scarcely ever see such work really executed even on lawns, much less in back yards of farm-houses; but there is no reason why, by a moderate expenditure of money, such places should not often be thus ornamented. It is only necessary to learn the way nature tumbles rocks together, piles earth in interstices, and sets out trees, shrubs and wild flowers over the whole.

ROCK GARDENS.—(After the London Gardeners' Chronicle.)—FIG. 554.

Work of this character has been done, though very seldom, in this country. Gardeners do not fail to give us ribbon borders of coleus and other bedding plants, but not wild gardens, and we all, for want of interest and originality, follow suit. Why it is I cannot say, but we seem wonderfully tied down to conventional rules of gardening in America. Everybody does the same thing. We are so fertile and original in our devices in other ways that it is evident we must lack greatly in genuine love for gardening, or we could not rest satisfied with so much conventional work of this character. Nor can we find excuses in the non-existence of good instances of natural rock-work in America that the masses can reach and study, for just such nooks as we are now considering have been made upon certain parks, both West and East, from entirely extraneous materials, and any one who will take the trouble and time can readily find out how the effect has been accomplished. But the expense of making such rocky nooks is, it will be said, too great for ordinary folks. Let it be so, though the expense is not really beyond the means of many owners of real estate in this country; but how about the nooks throughout all hill countries, where the work is already nearly done by nature and only needs a little planting, adjustment of rocks and turf, and a few hidden paths to make the loveliest of rock gardens. Surely it is not right to neglect such opportunities.

But let us study the parts of our picture in detail. The first thing we notice with pleasure is a copious stream; but the dash and play of its gliding and foaming waters are made particularly effective by the rocks. These support, characterize and modulate it to such a degree that neither the picture nor the waterfall would be anything without the rocks under and on either side. This way and that the rocks turn the water, and beneath the stress of their guiding power the stream, like a living thing, dances and murmurs and surprises us in a thousand delightful ways. But if we expect to succeed in putting these rocks together as we find them here, or as nature would pile them, it must be no haphazard piling. If we would only discern the spirit and intention of the work, we should find in full action definite principles of structure that must invariably govern the conformation of a similar, but really artificial mass. The rocks, we should find, have fallen chiefly from some one direction, and always, evidently from above downwards; or they show broad faces for the lichens and mosses or the exquisite painting of time and weather to ornament. Like the detailed effect of the finest painting, no stone of the natural rock pile has fallen in its place without a definite dynamic as well as artistic reason.

But to get mere rocks together in this fashion would be of little more value after all than to collect the heaps of stones that deform prominent spots on many lawns with their chaotic and obtruding nakedness. To construct a natural piece of rock-work like that of the picture, it is necessary to unite turf and plants with the rocks in definite, artistic proportions. Of a natural, and therefore properly made, piece of rock-work at least two-thirds should be of turf and soil; and the molding of this turf and soil to the valleys and slopes of the rocks requires a feeling for the ways of nature that can only be obtained by the study of nature itself. Rules are useless. It is well to remember, too, for convenience of construction, that the upper surface of the rock is all that shows above the turf, and that consequently it matters little if the rock section descends no more than a few inches below the surface, provided that it be well bedded. The rustic bridge is perhaps the easiest feature of all to contrive. If we look at the plants we shall find them consisting of trees, shrubs and herbaceous plants or wild flowers. Notice how they all, every one in its own way, play an equally important part in the scene. First, the background of large trees, oaks, maples, elms and chestnuts to individualize, emphasize and seclude the scene; then the trees and shrubs, upper and lower growths, that should always in some degree go together, flanking and masking the extremes of the bridge on either side of the water-fall. The pleasant surprise of entering on a bridge in this way is always peculiarly effective. Birches, alders, spruces, hemlocks, cedars commingle in these spots.

An occasional single tree of similar kind strays down the hillside, sometimes partially bare and sometimes completely clothed at the base with shrubbery, elders, dwarf willows, spiræas and the picturesque foliage of the sumach. Broad spaces of turf and bold obtrusion of rock surface extend throughout dotted with wild flowers. As we approach the edge of the main water in the foreground, tufts of wild grasses grow up and thick masses of shrubbery stream down and dip into its flowing surface. The grasses, yuccas and wild flowers spring up alongside the rocks, the climbers creep over their surface and the entire grouping of sky and sky-line, bridge, waterfall, rocks, trees, shrubs, wild flowers and climbers fall in definite proportions into a charming artistic whole that nature best knows how to create. We can only follow, not imitate, such natural features with any considerable degree of success, if we put aside conventional rules and study the very spirit of nature as displayed among rocks, water, trees, shrubbery and wild flowers.

DIVERSIFIED HUSBANDRY.

The Prairie, Park and Timber Belts of Central Minnesota. Their Prominent Commercial Center.

MESSRS. HOLMES AND SWEETLAND.

[Special Correspondents of the RURAL NEW-YORKER.]

DURING the past three months we have written nearly a dozen letters for the many thousands of readers of the RURAL, giving pen-pictures of the topography, information about the soil and climate, glimpses of the development, and statistics of crops, products, etc., in Northwestern Minnesota and Northeastern Dakota. The kindly admonition to deal with facts rather than fancies, and give figures as a substitute for the fiction indulged in by many journalists in writing for the Eastern press, has been constantly in view and closely adhered to; and yet, as a legitimate result of our travels, we are impressed with the fact that Minnesota is in many respects the most attractive State in the Union; and doubtless many who have perused carefully the correspondence referred to are similarly impressed, and the reading of this will obviate the necessity of recapitulation here. This letter briefly sketches the section of the State from the head of the Red River of the North, easterly to the Mississippi at Minneapolis and St. Paul, a region near the geographical center of the most densely populated part of the State. It includes a combination of the prairies, of the valley world-renowned for its wheat product; the park region dotted with groves, meadows and lakes, inviting the culture of cereals, root crops, and fruit, and affording every facility for stock-raising and dairy business; and the timber belt abounding in lumber, ties and fuel, with numerous thrifty farms and herds, in the good-sized openings and clearings with which it is interspersed. Here are combined beautiful topography, fertile soil, healthful climate, ample railway privileges, good schools, cultured society, and busy, prosperous towns.

At the junction of the Otter Tail River with the Bois de Sioux, whose united currents form the Red River of the North, on the line between Wilkin County, Minn., and Richland County, Dakota, are Breckinridge and Wahpeton; the former the county seat of Wilkin with semi-annual terms of court. The population last census was 321, now estimated at 500. A school building to cost $5,000 is in process of construction to supply graded schoolfacilities, and the Congregational Society will build a church edifice in the Spring.

The Wilkin County Record, published weekly, supplies the necessity of a local press, and would prove valuable in responding to inquiries. The A. F. & A. M. have a prosperous organization; and the hotels, stores, comely residences, grain elevators, rich agricultural surroundings, and the advantage of being a division point for terminal train service on the St. Paul, Minneapolis and Manitoba Railway, which here has a roundhouse as well as machine shops, turn-table, etc., give assurance of growth and permanency. Another road from Moorhead *via* McCauleyville on the *tapis*, and the Wadena Branch of the Northern Pacific is assured. The annual grain market is about 150,000 bushels. Lots range from $40 to $250 each; and land in the vicinity from $4 to $25 per acre. We incidentally learned that upon three acres, 1½ mile from town, there were grown this year 600 bushels of potatoes, marketed for $400.

WAHPETON, the county seat of Richland county, Dakota, is one of those Western marvels which are occasionally, but rarely, seen in the new Northwest; its population in June, 1880, was 100; and the census which has just been completed again for election purposes, shows 618. There are two churches, two newspapers, good schools, prosperous civic organizations, ample banking and business capital, stores well stocked and busy, lumber yards, grain elevators, and rich agricultural surroundings. The commercial business during the past year aggregated $500,000, and 150,000 bushels of grain were marketed here. The St. P., M. & M. R. R., branching from Breckenridge, across the river, really has its base for Dakota trade at Wahpeton, and the section of country to the northwest which it penetrates is very rich and productive, as also is almost the entire area of Richland County. Two other projected roads are coming to Wahpeton, of which we shall write more in detail next week, as the space we can devote here is entirely inadequate for an extended review of the interests of the town and county. There are many Eastern people here, and their æsthetic characteristics are finding expression in cozy residences and social and intellectual entertainments, as also in ornamenting the broad streets, planning for future lawns with trees, shrubs and flowers, and in many ways presenting special attractions fo the town.

WALCOTT, 27 miles from Wahpeton, on the St. P., M. & M. R. R., with its 100 population, was platted only last Spring by Mr. Frank E. Walcott. Nearly thirty buildings have since been erected on the site, most of them since July last. The location is high and pretty, being near the Cheyenne, Wild Rice, and Red Rivers, all of which are bordered with timber. The place has a prominent, handsome hill to the northwest. Its growth is notable; there are four stores for general merchandise, besides one each for

hardware, furniture and millinery, together with two blacksmith shops and other industrial interests; but a harness-maker, shoemaker, and representatives of other trades are needed. There is also a good opening for a bank, but the greatest necessity is a hotel, and a man who knows how to keep it. Lots are offered at reasonable prices, and such as will insure a profit on the investment. A good school building, church edifice, and several residences will be built next Spring, and the handsome depot to be erected will be a great addition. The country around is pretty well settled by Americans and Scandinavians, who are thriving and happy. No bonanza farms in the vicinity, but each owns his quarter or half section.

There are several other embryo towns on this extension of the St. P. M. & M., which we had not the time to visit, and cannot speak of their outlook, except that, being located in a section rich in natural resources, the growth and development incidental to immigration which is large and steadily increasing, will doubtless insure their future development.

Turning Eastward from Breckenridge, on the main line of the St. P. M. & M., we halted at

CAMPBELL, a nicely situated town of 100 population: the streets were full of farmers and teams, and business was lively. There are two hotels, three general stores, one each of hardware, drugs, and agricultural implements, a lumber yard, a round elevator of 30,000 bushels' capacity (run by steam) and a warehouse for 25,000 bushels, the two handling this season about 75,000 bushels of wheat.

A $2,000 school-house will be built the coming Spring, and other important improvements are contemplated. There is a good opportunity here for a furniture store, tailor, shoemaker and barber.

The farmers in the vicinity are of the best class of Americans, many of them coming from about Ottawa, in La Salle County Illinois, men of means, who are opening large farms, and are giving Campbell their patronage; but it is not to their credit that they are importing oats for feed and seed into a country where they can grow 75 bushels to the acre. Diversify your crops, gentlemen.

NOR CROSS (Gorton Station) about 20 miles further East on the line is not a yearling yet, but has the business and promise of many older towns, begotten of its rich surroundings and the energy of it proprietors. A feature is the high and handsome site, affording good, dry cellars, and excellent well water. Stores, elevators, and lumber yards are all busy. A hardware stock is needed and a desirable store-room just completed could be rented for the business. A hotel, harness maker, cabinet maker, and other workers in industries are also required. The rapid development of the surrounding country tributary to Nor Cross, will force other towns near-by to look sharply to their business laurels.

MORRIS, is the next place we visited. It is the county seat of Stevens County, and has a population of 1,150, showing an increase of nearly 400 in 18 months. It is beautifully located with attractive environs, lakes, groves undulations, farms, meadows and railways forming a picturesque landscape. Here are many substantial business buildings, home-like residences; churches; schools; an able press; civic societies; a public hall; several incipient manufacturing interests; water powers only partially developed; a superior quality of building material; three elevators with a total capacity of 16,000 bushels; a post office (of the third class) with an annual business of over $3,000 in stamps and postal cards, and over $10,000 in money orders; a market for 350,000 bushels of wheat within a year; a live driving-park association, and county agricultural society; a wide-awake board of trade; an annual commercial business of over $1.000,000. The place is on the main line of the St. P. M. & M., at the point where the Brown Valley branch diverges to the West. The many other points of interest needing discussion render it necessary to devote an exclusive letter to Morris and Stevens Counties, which we will endeavor to write within a couple of weeks. The population is largely composed of Eastern people, and the intelligence and refinement of their earlier homes are bearing fruit in the social and intellectual entertainments now organized under the auspices of the board of trade, and others in a general way; while the natural resources of the county for a multiform interest in husbandry assure a rapid and lasting prosperity.

BENSON is the county seat of Swift County adjoining Stevens on the southeast. It commands an attractive site, is nicely laid out with wide streets well graveled. It has a thorough system of sewerage east and west on either side of the railroad, emptying into the Chippewa River, which, with the healthful climate, affords almost entire immunity from sickness—only three adult deaths since 1876. There are a good graded school, three churches, and a live, seven-column folio paper, under the charge of Edward Thomas.

Here are two large elevators, and a wheat market for about 400,000 bushels per annum. The handsome hotel, the "Aldrich Brothers' House," is a three-story brick structure of 42 rooms, well furnished and well kept; an ornament and benefit to the town.

Land in this county is worth from $3 to $7.50 per acre. It is well adapted to tame grasses and stock-raising, as well as to the usual variety of crops, and the farmers should avail themselves more fully of these advantages. The United States Land Office here finds its principal attention to be required in "proving up" claims and a few entries of contested tracts. The banking business of Benson is estimated at $700,000 (?), and the commercial trade at the same figure.

WILLMAR, the county seat of Kandiyohi County, has a good school, a live newspaper, a few good business buildings, elevators, a mill, and a rich county surrounding it. The population of town and county is almost entirely Scandinavian, and the leading business man (so-called) in the town (and an American at that) told us they did not want Eastern people to settle in the county, and significantly added, "We could not get them if we did." Hence, as we are writing for Eastern readers, we will desist from further comment.

LITCHFIELD, 77 miles from St. Paul, with a population of about 1,500, is the county seat of Meeker County, which, by the way, is one of the choicest in Central Minnesota. Prettily located, with every accessory for thrift in both town and county, it, of course, depends largely on the spirit and enterprise of its citizens to solve the problem of future distinction, and these are by no means deficient. The happy combination of the American and better class of the foreign elements keeps all enterprising and progressive. Churches, schools, civic organizations, banks, a board of trade, newspapers, manufactories, elevators, lumber yards, good stores and stocks, and hotels (notably the new Howard House), all attest the commercial importance of the place. Three weeks hence we shall give our readers the details of this town and county in a special letter. There are several large, prosperous towns east of Litchfield, on the line, of sufficient importance to merit a visit and extended notice, and we regretted our inability to stop, but time precluded.

Nearing Minneapolis we come to Lake Minnetonka, becoming world-renowned, and upon the attractions of which volumes have been published from more able pencils than ours. It has an entire length of 17 miles, 208 miles of shore line, and embodies about 82 square miles, with 10 islands, varying in size from one to 600 acres. Large hotels, several spacious boarding houses, numerous cottages, large steamers, sail and row boats, are among the conveniences which this wondrous resort adds to its marvelous beauty. Those in quest of health, rest, recreation or sporting are everywhere turning to Minnetonka, as shown by its 20,000 visitors in 1881.

A word in conclusion: Nearly the entire country under notice is specially adapted to stock-raising and dairying, yet the attention to both these is far below the possibilities offered. Rich, nutritious grasses, pure water, an abundance of timber for Summer shade and Winter shelter, a pure, invigorating atmosphere, a rich soil for producing feed of any variety desired, all exist in profusion; and why do not the farmers emulate the example of those in other localities, Iowa, for instance, and acquire for themselves a reputation abroad for their creamery butter and cheese?

Entomological.

PEACH TREE BARK BORER.

Important Note from Professor C. V. Riley.

MR. A. J. CAYWOOD has been kind enough to send me specimens of the beetle which is doing such injury to his peach trees, and which he referred to in his communication of November 13 as a new insect. The beetle proves to be an old acquaintance (Phloiotribus liminaris, Harris), long known to injuriously affect peach trees. It is referred to by Harris under the old generic term Tomicus, on page 88 of his well-known work on Insects Injurious to Vegetation and has been supposed to be the cause of yellows (see Miss Morris in Downing's Horticulturist. vol. IV., page 502). That the injury of the insect would produce an unhealthy, yellow appearance of the tree, or that it will most abonnd in trees affected with yellows is natural, but that it is the first cause of yellows there is no reason to believe, but, on the contrary, every reason to doubt. In regard to the doubt existing in Mr. Caywood's mind as to the mode of propagation of the species I would remark that as with other species of this family (Scolytidæ) the eggs are laid under the bark the beetle first boring into the bark for this purpose.

It is very difficult to prevent the injury of this class of bark-borers. From experiments made with a view of preventing injury from other boring beetles, I feel satisfied that a good coating of a mixture of lime, sulphur and Paris-green will protect a healthy tree that is not yet attacked as long as the coating lasts; and, judging from a specimen which Mr. Caywood has sent, a coating of black varnish will destroy all the borers, though whether or not it will injure the tree can only be decided by actual test in the orchard.

WASHINGTON, D. C.

THE PEACH TREE BARK BORER.

THE peach tree bark beetle, "gum bug," noticed by your correspondent, Mr. Caywood, in two very interesting articles in the RURAL, is quite abundant in this vicinity, causing the "yellows" and very soon killing the tree—generally in two years, I think—precisely as observed by Miss Morris, in 184-, as recorded by Harris in "Insects Injurious to Vegetation." I think this must have been first seen and described by Dr. Harris before 1840, as he says it was recorded in his catalogue. It must have been injuring peach trees as early as 1843, at least, for he says in 1854, in a paper to the Massachusetts Horticultural Society, that it had been eleven years since the peach trees had been noticed to be affected by "yellows." He also says, "I cannot find any Tomicus liminaris at work in the bark," still I think they must have been present there. Generally, no extra scrutiny is required to detect the burrows in the bark, but the examination should always be made at the ground, near the roots, to be certain in regard to their presence in an orchard. When we see a tree at this time of the year with its fruit (or some of it) still on its branches in a "mummified" form, we may be quite sure the bark borer is at work in its trunk. This beetle is a much more serious pest than any of the other injurious insects, attacking and burrowing in the trunk and branches of the peach tree.

This beetle—Phloiotribus liminaris—(Harris) is very closely allied to the clover root borer, Hylesinus trifolii (Mull.) with which it would be confounded by any casual observer, as it is colored and shaped exactly like it; though a very little smaller. It actually differs only slightly in its structure as seen under a microscope, as noted by Le Conte in a foot-note of Harris's work. If Mr. Caywood is right, it resembles the clover-root borer, too, in its habits, viz., attacking, healthy, vigorous and growing plants.

Now a great many of the members of this family attack plants and trees which are sickly, or in incipient decay. Hylesinus opaculuo—(LeC.) is found in soft maple trees, which are partly dead. These beetles are always found in boundary sections, between the decaying and living tissues of the tree. H. aculeatus bores in the bark of all ash trees felled the previous Winter. The female and her mate burrow into the bark in May, the former laying the eggs as they channel along. Thus the larva channels at right angles, forming that delicate curving we see on ash rails, after the bark peels off.

Wayne Co., N. Y. W. L. DEVEREAUX.

Gas Tar a Protection from Tree Borers.

In the RURAL of Nov. 10th Mr. A. J. Caywood asks how to protect his peach trees from the new insect boring in the bark. In reply I would inform him that eight years ago I made an experiment in coating some wild trees from the roots to branches with gas or coal tar, and finding after one year the trees uninjured and in full vigor, I made the same application to my peach trees, by removing the earth from around the trunk for a few inches and coating the exposed part below the ground to a foot above ground with gas tar, after which I replaced the earth, and to this day no borer has ever touched one of these trees, and they have made a fine growth and produced plenty of fruit each year since, while the peach trees of all my neighbors are half-dead, and the other half is dying, showing a thick band of exuding gum at the surface of ground, where girdled by the borer. I would advise Mr. Caywood to try the gas tar, extending the coating up into the main branches. It will surely clean out the insects, and instead of injuring the bark it preserves it from mosses and vegetable as well as animal parasites. Apply on the bark directly with a paint brush. If the tar is too thick warm it a little, and whatever the entomologists may name the pests, they will never trouble your trees again. A. ROST.

Suffolk County, N. Y.

Chalcid Parasites on Orange Scale-Insects.

Professor C. V. Riley sends us the following extract from the diary of Mr. H. G. Hubbard, as indicative of the condition of the orange scales at this season in Florida, Mr. Hubbard being stationed there to make observations on orange-tree insects:—"Nov. 25th. Visited several orange groves to inspect the condition of scale and rust louse. The Coccidæ continue to breed, and young are seen crawling about as well as males. There is, however, no marked sudden increase, as at the time of the October brood. The present appears to be a period of greatest increase of the Chalcid parasites, and many trees are seen upon which the scales are attacked by the Chalcidæ to such an extent that the branches present the same appearance seen in the majority of infested trees during the last week of October and first of November. That is, the scales, particularly on the leaves and twigs of new growth, are nearly all one-third of full size, and have, in the case of long scale, the bright color of young scales of a late brood. This is due to the arrested growth from attacks of parasites, which have not yet issued from the scales. The above refers to Long Scale more particularly, as in the case of Chaff Scale the Chalcid parasites do not invariably confine their attacks to immature scales, but appear to infest even those which are adult and full of eggs; in these cases they feed either upon the eggs, or the coccid itself, or on both."

Veterinary.

NOT PUERPERAL FEVER IN THE COW.

THE case mentioned by a correspondent in the RURAL of Nov. 5, page 748, is not one of puerperal fever at all. It might have developed into this disease or into some other kind of fever; but in the case mentioned it was simply a chill brought on by exposure to cold rain. It was a case requiring an active stimulant, and the cayenne pepper produced precisely the action required. The other case mentioned is quite as reasonable, and saltpeter, a cooling refrigerant and febrifuge, is quite often beneficial in a case of true fever.

These cases show how important it is for persons owning valuable cows to make a study of their ailments, and also how easy it is for a person who really knows nothing of medicine and the nature of popular rough-and-ready remedies to make serious mistakes; also how sometimes a person may hit a "bull's eye" without aiming at it. Had the cayenne been given to a cow suffering from true puerperal fever, with the circulation excited to its highest point, the stimulant would probably have killed the cow in a short time. Puerperal fever occurs nine times out of ten from internal causes, and not from exposure, although in some cases exposure to cold or excess of heat, or nervous excitement is the proximate cause of it. In the case mentioned the old dairyman was right; a pint of whisky or gin might have had the same effect. The only error made was in mistaking a chill for a fever, which may result from a chill, but is a very different thing from the chill itself. H. S.

For Women.

CONDUCTED BY MISS RAY CLARK.

WAITING FOR MOTHER!

MARY D. BRINE.

"THE old man sits in his easy chair,
Slumbering the moments away,
Dreaming a dream that is all his own,
On this gladsome, peaceful day.
His children have gather'd from far and near,
His children's children beside,
And merry voices are echoing through
The "Homestead"s hall so wide.

But far away in the years long flown
Grandfather lives again;
And his heart forgets that it ever knew
A shadow of grief and pain,
For he sees his wife as he saw her then—
A matron comely and fair,
With her children gathered around his board
And never a vacant chair.

O! happy this dream of the Auld Lang Syne
Of the years long slipped away!
And the old man's lips have gather'd a smile
And his heart grows young and gay;
But a kiss falls gently upon his brow,
From his daughter's lips so true:
"Dinner is ready; and, Father, dear,
We are *only waiting for you.*"

The old man wakes at his daughter's call,
And he looks at the table near,
'Ther's one of us missing,' my child, he says
'We will wait till MOTHER is here.'
There are tears in the eyes of his children, then,
As they gaze on an empty chair;
For many a lonely year has passed,
Since "MOTHER" sat with them there.

But the old man pleads still wistfully:
We must *wait for Mother*, you know!"
And they let him rest in his old arm chair
Till the sun at last sinks low,
Then leaving a smile for the children here,
He turns from the Earth away,
And has gone to MOTHER, beyond the skies,
With the close of the quiet day.

CONCERNING CHRISTMAS GIFTS.

MARY WAGER-FISHER.

THE wise gift-maker at Christmas time prepares all her gifts as early as October, and so avoids the hurry that attends the making and purchase of them on the eve of the Christmas holiday. But from a multitude of reasons very few of us may be counted among the

"wise." We either have not the money or the leisure, or we forget about the annually-recurring event which puts a large part of the Christian world in a state of excitement until it is fairly upon us. I long ago came to this conclusion, which every Christmas time tends to confirm, that the sweet saying of Christ, "It is more blessed to give than to receive," is rapidly losing its significance. I see so many hundreds of women driven half distracted at holiday time in their efforts to make one dollar do the work of ten; so many hundreds of shop girls, too, nearly "worked to death" in the crowded shops in an endeavor to answer the demands of the eager shoppers, that I weary at the sight, and deplore the gift-making mania that makes Christmas anything but a joyous holiday. A great many people spend more on gifts than they can afford to spend, and money is often put into purchases that are of no use to the recipients of them. People who have plenty of money have no difficulty in choosing their gifts; the products of thousands of deft fingers, the world over, are temptingly arrayed in the small and great shops of every large town. But with people whose means are small, it is often difficult for them to choose. They are usually concerned, too, that their offerings possess the merit of utility, which is an important factor in gift-making. The taste and condition of the persons to whom the gifts are to be given must also be taken into account. A standard gift is books, but from my own experience I should say that no gift-making is so hazardous as that of books. How many people look at their book shelves and sigh at the sight of some of the volumes. Unless I knew that my friend wished such or such a book, I should not waste my money upon it. There are certain standard books that people with good literary taste always find satisfactory, as Shakespeare, Plutarch's Lives, Motley's Rise of the Dutch Republic, Green's History off England, and certain leading poets of the day, as Emerson, Longfellow, Tennyson, Holmes, Whittier, Lowell, etc. I should not advise novels as gifts, except in rare instances. People seldom read a novel more than once or twice. There are a few that are great, and may be re-read many times with both pleasure and profit. One of these is the interesting story, Vicar of Wakefield, by Oliver Goldsmith. Some people are very fond of Dickens's novels; other like Hawthorne's. All volumes of Emerson's Essays is delightful to the better class of readers. Of biographies, Boswell's Life of Samuel Johnson is a famous and very interesting book. Trelawney's Life of Lord Macauley is very good, Trollope's Life of Cicero is to be commended to the studious people who have a liking for the history of famous people in the times gone by. If your friend's birthday happens to come on Christmas or New Years, nothing is more fit than for a gift than the Longfellow, or Emerson, or Whittier Birthday Book. The gift of a year's subscription to a good journal like the RURAL, for example, is one of the best of gifts, as it brings down upon the head of the giver fifty-two blessings a year.

A good picture is always an acceptable gift. But unless you are a competent judge of artistic work, don't put your money into a chromo. There are a few good chromos in the world, and thousands that are atrociously bad. It is much safer to choose prints, as photographs, lithographs, heliotypes and steel engravings. Avoid colored prints, unless, as I say, you are a judge of what is good. The heliotyes from the old masters, published by Osgood & Co. of Boston, are very fine, and they cost but fifty cents apiece. A catalogue will be sent gratuitously on application. A good steel engraving is costly, but it is a thing to last for generations, if well framed and well cared for. Some of the art publications contain in each issue three or four good engravings or etchings.

Emerson says something to the effect that a gift should be of one's self, the work of one's hands or brains. If you paint a cup or vase, or a picture, or embroider a lady, or make a mat, cushion, or quilt, you give of yourself, of your handiwork, and the sincerest of such gifts possesses a specific value. A copy of the Revised Edition of the New Testament would be acceptable to almost any adult who is not already provided with one. Very good copies, with the old and new versions on opposite pages, can be had for fifty cents. To a housewife interested in cookery a cook book would form a pleasant gift. One of the best of the new ones is Miss Parloa's. A thermometer costs from fifteen cents up. Everybody does not have one of those. A thrifty potted plant forms a nice gift. A basket of apples, of nuts, or of vegetables to such as have none, with many people would not come amiss.

Children suffer most, probably, at Christmas from the foolish giving of friends who would more properly be styled "enemies." Candies, raisins and such sorts of sweetmeats are abominable to give a child. Kindergarten blocks and building blocks form endless amusement for the little folks. Avoid all colored blocks, unless they are in *oil* colors. A box of paints, tools, tin cars, things which can be used to fashion into other things, to be talked about, over which the imagination lingers, are all good. A stout lead pencil, with a quire of writing paper to scribble on would delight some children. Things to go into the stomach have an evanescent value, except to the poor whose hunger is uppermost of all wants. And in Christmas giving it is better to remember the poor in the neighborhood than your "relatives." They feel neglect so keenly, and it is far harder for "Santa Claus" to remain away from the homes of the poor than the rich. People who are in comfort and health enjoy Christmas, whether it brings gifts or not. To fully enjoy the day it is better to expect no gifts, and not to overburden one's self in trying to make them. A happy face and cheery words are the brightest and best things any Christmas can be blessed with, and one can give expression to good wishes, that cost nothing and may be worth much. With people of limited means it is better to confine gift-making to one day in the year. Among married people there is the yearly anniversary of the wedding day. The birthdays of the children it is well to celebrate in some way, and most children take great delight in celebrating the birthdays of their parents. The "blessedness" of a gift at any time is its spontaniety. There is nothing "blessed" in giving because you think you "ought" to give. If you can't give with pleasure, why then do not. "Compulsory" gift-making is a nuisance either at Christmas or at a wedding.

Domestic Economy

CONDUCTED BY EMILY MAPLE.

CONCERNING HOUSEHOLD SERVICE.

MARY WAGER-FISHER.

THERE are certain sorts of household service for which it is next to impossible to procure proper persons. For instance, if I wish my table set for a small dinner party, flowers arranged, closets and rooms put in my required order, my child's health intelligently looked after during my absence of a day or a week, the mending of clothes, the temperature and ventilation of rooms justly attended to, and the thousand and one things connected with housekeeping that require good common sense, taste and intelligence, I should not know whither to turn to find such a person male or female. There are hundreds of women, in ill health or burdened with the care and wants of a large family, to whom such help would be invaluable and for which service they would gladly pay wages ranging from $2 to $5 per week, and still for this demand there is *no supply*. Between mistress and cook there is *a gap* so difficult to fill that many families break up housekeeping in order that the wife and mother may be relieved of the burden she is obliged to carry as mistress of a house. The sort of help required goes under the name of "house-maid," but she is so rarely well equipped for her office in this country, that the name itself is almost a misnomer. Grown-up daughters and dependent relatives often perform these services for the mistress, but there are thousands of families in which there are no such "spokes" in the family wheel.

My object in alluding to this matter is to enlist, if it be possible, the interest of country girls in this kind of work. It is an employment that is healthier, more respectable and better paid than that of factory or shop girls and I believe I may truly add, more profitable than dress or bonnet making or any sort of sewing, and to my mind, quite as respectable. I honor all workers who do their work well, no matter what it may be, save that it be honest, useful work. And so does everybody whose respect and esteem are worth having. If there is any reason why "hire-girls" are imbued with the idea that their occupation is regarded as very inferior, it is solely because they have been so outrageously ignorant, unskilled and unfit for the position. Almost any servant whom I might wish to hire to do my housework would demand from $3 to $4 per week for her services and still she would never be able to see whether or not she had the rugs straight on the floor or whether a picture frame was left askew after she had dusted it.

My husband had occasion one time to advertise for a maid for me to do very light work, but she must be trustworthy, and her wages were to be $2 a week, "a good home and kind treatment." There came upwards of 40 applicants for the situation, and among the number were several shop girls. I remember one in particular; she was a very a nice-looking young woman who had been a clerk for several years in a Philadelphia dry goods house at a salary of $6 a week. She found that her expenses consumed all her earnings, that she lived shabbily in a boarding house, that she had not really good society and that being so much on her feet and oftentimes in an impure atmosphere was killing her. She was heartily tired of it, and looked forward to a quiet home, in a quiet family, with a great sense of relief. Then, too, in such a position she would have no expenses but for her dress, and at the most she could put half her earnings every year in bank.

Employers know, if employees do not, that domestic service is the best paid, comparatively, of any sort of work, and it is a matter of wonder, as well as of surprise, that so few American girls fit themselves for such work; and of regret, too, as the quality of the deftness and intelligence of American girls is much superior to that of those of foreign birth and training. Now why is it that country girls who have their own way to make, turn aside from housework to seek other employment? Wherein lies their dislike of it, their repugnance to it? I wish some of them who may read this would frankly tell *why*.

I know of no occupation that is not attended with some unpleasant features, and it should be remembered that the unpleasant features of household service are often more than over-matched by disagreeable features in other occupations that they know nothing about because they have never experienced them. For instance, I have known "hired-girls" of mediocre intelligence, who for the life of them could not earn over 50 or 75 cents a week beyond their board, refuse to work in families where they were not admitted to the family table like a member of the family. "I am just as good as they are," they angrily argue, while it is not a matter of "goodness" at all; neither of social equality, for that matter, but simply a matter of family privacy. Employers hire help to do work; they don't hire them for their "society," delightful as such society may be, or otherwise society is a gratuitous sort of article that nobody likes to have imposed upon him against his will, which he *does* like to have when he seeks it, but which is not always to be had for the seeking. It is not at all of a commercial character, and the persons unquestionably whose society is most honored and courted are those who have the least of the spirit of caste. Caste, which is the brief expression for "I-am-decidedly-rather-better-than-you-are," is most marked in the lower grades of society and diminishes as one rises in the social scale. Great men and women never feel it and never think of it in connection with themselves, but they certainly do care for family privacy and will have it at all cost.

ECHOES FROM EVERY-DAY HOUSE.

ANNIE L. JACK.

DURING a week's absence from Every-day House, with seldom two meals at the same table, I had opportunity for noticing the different methods and manners of serving dishes practiced by various housekeepers. In one family, where everything in the parlor is dubbed "æsthetic," the bone of yesterday's leg of mutton was put upon the table in all its bareness. Plenty to eat there was, but it lacked the little touches that go so far to make food appetizing. Cold mutton was the substance of another lunch, but it lay in thin slices on a large platter, with a few pickles here and there around the edges, and a few sprigs of parsley were an added decoration.

At another house, where chicken had been the dinner of the day before, we were served with what the French call *Vol-au-vent*, a sort of patty of light crust, filled with hashed chicken. These, besides being a nice relish, were meant evidently to help out the dinner, otherwise rather short for unexpected guests. One morning at breakfast I noticed that the children, who were of rather dainty appetite, passed their plates several times for a dish of what looked like peculiar doughnuts. After they had gone to school I found that their mother moistened all the stale bread first in milk, then in the yelk of eggs beaten lightly, afterward sprinkling each piece with pulverized sugar, and frying it crisp. It was very palatable. One afternoon for tea a friend treated me to cheese cakes, and when I praised them as something I had never relished before since my childhood days, she laughed very pleasantly, and gave me the following recipe, which the amateur cook intends soon to try at Every-day House:—Potato Cheese Cakes.—Two cups of mashed potatoes, half a cup of cream, four eggs, one-fourth of a cup of currants, one-half a cup of butter, one-half a cup of sugar. Mash the butter, eggs and cream with the potatoes hot; stir till scalding hot, remove from the fire, and stir in the washed currants and sugar. Fill your patty pans, after lining them with puff paste, and bake in a steady oven ten or twelve minutes.

At one pleasant fireside where I spent a day I felt the influence of a woman's dainty touch and innate refinement at every meal. Going in after the table was set, and no guest expected, I found the table linen spotless, the glass shining, and if flowers were few, they were interspersed with sprays of trailing green that added to their beauty. Fancy bits of pottery held the different articles of food, and though not rare or old, they were in exquisite taste and of pretty design. The cooking was always done to a turn and seasoned to delight an epicure, and all with the assistance of one girl. But I observed that everything was convenient—the rooms on one floor, so that no extra steps were required. The children had been taught that there was a place for everything, and the boys expected to help in many little ways in the household as well as the girls. The "help" was strong and capable, with a contented look that only comes from being well treated and cared for in a pleasant home.

What a diversity of character one meets in a few days' travel, each intent on his or her own round of duties and pleasures. The habit of observation is developed by seeing new faces, and we are sure to draw conclusions and make comparisons that become memories when once more we are settled down to the routine of home life.

WAS IT INDEPENDENCE?

MAY MAPLE.

"I AM going to earn the money wherewith to purchase my Christmas gifts, and I am determined that whatever I get for my husband it shall be something really elegant," said a young wife, and her snowy fingers drew the needle back and forth through the dainty wool, stitch by stitch adding to the pretty fabric that would shape itself into a warm, comfortable hood. It was still early Autumn; but when the winds and snows of Winter should make their appearance these becoming hoods would have increased to a goodly number, and then she would bring them forth for sale; and this was the way the fair little woman was to earn her pin-money for the Christmas holidays. "Of course," she continued, "he gives me all the spending money I need for myself and the baby, and would give me more if I wanted it, but I won't take his earnings to buy presents for himself. I like to be independent."

At first thought, this pretty independence seemed very laudable, and I almost envied her the leisure so much at her disposal; yet I could but wonder how she would gain time enough from the little family cares to make very elegant presents. To be sure her family was small—herself and husband and a six-months-old baby (but that really needed a great deal of care, as the child was far from well), and then her husband was a professional man, and there was always more or less company. So the cares of the little household were necessarily numerous.

But the child-wife (for after all she was but little else, notwithstanding her year and a-half of married life) soon informed me that she had become worn out with doing the work, and so her husband had hired a girl to do the kitchen work, and she was so glad, for she did dislike the drudgery. But then, too, she hated to eat from dirty dishes, and she had been half tempted to turn the girl away for her slovenly habits; and then came the usual flow of gossip concerning servant girls, which the little woman had learned to perfection.

Presently her husband came in desiring an early supper, as he had business in another part of the town requiring his presence. There was neither bread nor meat in the pantry. The girl had just come in from an afternoon visit, and could do nothing till she changed her handsome gown for an all-work affair; and then she could not possibly build a fire, make warm bread and get the supper ready on such short notice, so, with a contemptuous "Pshaw!" the husband sent a street boy to the bakery for bread and cake and to the butcher's for meat, while he built a fire in the kitchen stove. Meanwhile "the girl" made slow preparation to prepare the evening meal. The white table linen was all soiled or in the basket of unironed clothes, and the mistress was obliged to use colored napery, much to her dissatisfaction.

While all this hurried commotion was going on in the domestic department I began to wonder which the husband would most appreciate, an elegant Christmas gift from his wife, purchased with her own earnings, or a well-ordered house, whose pantry could give forth an abundance of well cooked food at a moment's warning, and a simple token of love for the holidays. Would the gift she proposed to purchase be her own independent earnings when, to do the work proposed, she must take the time that should be spent in overseeing the work in every department of her home? Was it true independence to do fancy work to please the eye and replenish the purse, and at the same time purchase bread at the bakery, when one kept a hired girl to do the housework for a family of three or four persons?

News of the Week.

SEVEN YEARLY SUBSCRIPTIONS WITH $14 ENTITLE THE SENDER TO THE RURAL NEW-YORKER FOR ONE YEAR FREE.

HOME NEWS.

Saturday, Dec. 17, 1881.

GUITEAU TRIAL.—Nothing out of the usual course of events has happened in the great trial or farce, we hardly know which to term it, during the past week, except the indisposition of two of the jurymen. Owing to the overcrowding of the court room the health of all present is placed at risk. The room is but 50x70 feet in size, and into this the crowd presses, the spectators bringing their lunch with them and consuming the pure air which is barely sufficient to keep those who belong in the court room in good breathing material. Considering the fact that the protracted sickness or death of one of the jurors would necessitate a new trial, or rather a repetition of a farce of which the whole country has already had enough, proper precantion, even to the exclusion of the spectators, should be taken.

For another week Guiteau has been insulting the judge, jury, witnesses and nearly every one else who has anything to do with the case. His divorced wife testified that she had never observed indications of insanity in his conduct. Two experts deposed that careful examinat ons failed to reveal any malformation, and one of them, Dr. A. McLane Hamilton, declared he thought the prisoner while in court was playing a part. Mr. Scoville will attempt to break down the testimony of the witness who recently testified that he had heard Guiteau say that he would make himself notorious by killing some great man, as Booth did. After the court adjourned on Friday a mysterious box, which had arrived by express for Guiteau, was opened and found to contain a hangman's rope sent from Myersville, Pa. Mr. Scoville also received a postal card notifying him to watch the van on Dec. 21, as men had been detailed to take Guiteau's life. Mrs. Scoville is very apprehensive that her brother will be assassinated.

The special committee appointed by Congress to arrange memorial services in honor of the late President recommended that some eminent citizen and orator who has been on terms of intimacy with Gen. Garfield, be invited to deliver the principal eulogy, and Mr. Blaine has been since selected, with two members of each House to follow with brief speeches, the services to be closed by prayer. It will be remembered that the memorial oration upon Mr. Lincoln was delivered by George Bancroft.

The fund for the monument to Garfield at Cleveland may very likely reach $100,000 in time. It is now about $72,000, of which Ohio has given nearly $60,000 and the rest of the Union about $12,000; and of Ohio's portion about $50,000 were contributed by Cleveland. Expectations are raised that the relics constructed from the wood, cloth, and other material used around the catafalque will net a handsome sum for the building fund, to which the proceeds are to be devoted. These relics have lately appeared in several cities, including New York, and are advertised with the holiday goods, the authenticity of each memento being duly certified.

Mr. Frelinghuysen of New Jersey has been nominated and confirmed to be Secretary of State *vice* Mr. Blaine resigned. He will assume the duties of office on Monday.

Mr. Scoville, Guiteau's brotherin-law and counsel, lectured in Washington on the case and complained of the general disposition to consign his client to the gallows regardless of the open question as to his sanity. He stated his belief that the prisoner will be assassinated before the end of the trial.

In the House of Representatives on the 13th 752 bills and joint resolutions were introduced by 113 members, the call resting with the State of Massachusetts. Had the call continued until all the Representatives and Delegates had been afforded an opportunity to unload themselves, the titles of about 2,000 bills and joint resolutions would have appeared upon the first calender of the session. The bills brought in relate to a vast variety of subjects, including internal revenue, the tariff, coinage and currency, Indian affairs, reapportionment, etc.

Some weeks ago a number of business men of Cincinnati, desiring to compliment Atlanta, and especially the Exposition in progress there, prepared a floral ship called the "Atlanta," and, with a party of ladies and gentleman, bore it to Atlanta and made a formal presentation of it to the managers of the Exposition. On the 15th inst. it was returned in charge of a party of ladies and gentlemen of Atlanta, not as a floral ship, however, but freighted with Southern products. Its sheathing was of cotton, and it was profusely bur-dened with all manner of Southern products. It was a pleasant exchange of courtesies between the two cities.

It is stated on good authority that the following remuneration is to be made to the physicians and nurses of President Garfield:—Congress will be asked to retire Surgeon General Barnes with the rank and pay of a major-general instead of a brigadier as he now is. Dr. Woodward, now holding the rank of major in the Medical Corps, is to be advanced by act of Congress to the special rank of colonel, to be created for him in recognition of his services to the wounded President. Under the act to pay all the expenses incident to and incurred by President Garfield's illness and death, bills to the amount of $110,000 or even $125,000 will come in. Of this appropriation Doctors Bliss, Agnew and Hamilton are to receive two-thirds, which would give to each about $24,000 or $27,000. The physicians say that under no circumstances will they present bills either to Mrs. Garfield or against the estate of her deceased husband. The four nurses are to receive $2,500 each. Dr. Lamb, of the Surgeon General's Office, is to receive $100 for the autopsy which he made. Dr. Reyburn, who was Dr. Bliss' assistant, will also receive a reasonable sum for his constant attendance.

Mr. B. H. Brewster of Philadelphia was nominated on Friday by President Arthur to be Attorney-General. He is an able man and a ready orator.

A colony 5,000 strong, invading Indian Territory from the Texas border, has laid out a town site, Oklahoma City, and does not anticipate expulsion.

"Feel Like a New Person."

A patient, after giving Compound Oxygen a trial, writes: "Headache all gone; good appetite, and can sleep well at night without coughing, a thing I have not been able to do for a year. I feel like a new person. I can breathe now." Treatise on Compound Oxygen, *sent free*. DRS. STARKEY & PALEN 1109 and 1111 Girard Street, Philadelphia, Pa. —*Adv.*

AGRICULTURAL NEWS.

Saturday, DEC. 17, 1881.

The following items of agricultural interest have been condensed from cablegrams received here between yesterday noon and noon to-day:.....

Portland Me: County produce continues to maintain good prices. Boston, Mass: A better feeling in wool, with an increased demand. Sales of the week 2,350,000 pounds of all kinds. Sales of Mich. Fleeces 405,000 pounds at 40@43c, the latter for choice; principally 41@42c. for average lots. Ohio and Penn. fleeces bring 42@43½ for X, and 43@44c. for XX and above. Combing and delaine fleeces quiet at 49@50 for fine; coarse dull at 36@42½; unwashed combing 27½@34c.....Utica, N. Y. Creamery butter 32c@35c: dairy, 25@30c. Cheese 12@14c; eggs, 28@29c; limed 24c. per dozen. Loose hay, $13@15; baled, $16@17; oat straw, loose, $8@9; baled, $10@12.....Philadelphia, Pa. During the past few days there have been a better feeling and a greater inquiry for wool than for some time previous. Should this result in large sales, the market will be strengthened, but at this late season many holders are disposed to accept present prices rather than hold much into the new year. Buyers of cotton are well stocked—a decline of ⅛c. from last week's rates reported. Breadstuffs not very active; prices on several grades a trifle lower than a week ago. Rye and corn dull, demand nominal. Buckwheat meal slow at $4@4.30. Demand for apples less than supply—principally inferior sorts. not sought for. Butter and cheese, prices unchanged. Eggs, too, firm. Supply of potatoes good; best stock selling at former prices.....

Cleveland, Ohio.—Mess pork, $17.50; weather cold and clear.....Cincinnati, Ohio.—Tobacco in fair supply. Grain and flour light. Hogs coming in fairly.....Toledo, Ohio.—On account of mild weather, heavy rains, and bad roads, not much country movement of late. Grain market weak with a downward tendency.....Louisville, Ky.—Mild weather continues. Receipts and shipments of grain, good. An active demand for corn for distillers and feeders; No. 2 white, 72c.; do. mixed, 68c. Wheat, $1.35. The wheat prospect in Kentucky is reported excellent. A material increase of cotton receipts here over those last year. The cotton section tributary to this place has suffered severely from drought, and the yield is less, but local factors are covering much larger territory than heretofore. Country collections good.....Chicago, Ill.—Only a moderate business in grain. Receipts of breadstuffs for the week: 95,491 barrels flour; 218,408 bushels of wheat; 660,465 bushels of corn, and 345,766 bushels of oats. Shipments 85,640 barrels flour; 142,193 bushels wheat; 607,280 bushels of corn and 230,963 bushels of oats, leaving on hand 3,800,000 bushels of wheat; 5,550,000 bushels of corn; 554,000 bushels of oats; 363,560 bushels of rye and 221,960 bushels of barley. At same date last year there were in store 6,412,929 bushels of wheat, 4,208,575 bushels of corn; 1,378,853 bushels of oats; 297,219 bushels of rye and 230,663 bushels of barley. Travelers just returned from Iowa and other points in the Northwest report that a large amount of wheat is still stacked, farmers holding it in expectation of better prices in Spring: prices are expected to reach the top in May.....

Peoria, Ill.—Country roads getting in better condition, and country selling and buying are much brisker.....Detroit, Mich.—Business here and in the interior of the State quiet. Lumber market growing stronger and stronger owing to the prospect of an open Winter checking logging operations. Pork packing very active, but the movement in dressed hogs is light. Grain trade entirely speculative. Wheat unsettled. No. 1 white, $1.34 cash; $1,40½ for April delivery. Corn steady; No. 2, 66½c. Lake navigation just closing.....Burlington, Ia.—Country roads bad; but collections fair.....St. Louis, Mo.—Provisions weak and fluctuating. Leaf tobacco is dragging badly and the weather is unfavorable for a new stock. For the week grain has been notably dull, but it is now strengthening. Demand for cattle exceeds supply; but no advance in prices. Two cold days have caused an average advance of 10c. per 100 pounds in hogs;.....Milwaukee, Wis.—Weather throughout the week stormy but variable, finally clearing off cold and bracing. A liberal out-put of currency has gone to the country, as the improved condition of country roads has resulted in a liberal movement of produce and grain, the wheat receipts averagiug nearly 5,000 bushels daily. Grain shipments small. Much of the wheat received is said to be damp and damaged. Flour still quiet. City mills run a few hours daily for local consumption. Wheat No. 2, Milwaukee Soft, $1.28⅛, cash; $1.32, May. Provisions strong at an advance of 5c. on last week. Receipts largely in excess of those at this time last year. .....

Minneapolis, Minn.: Weather still fair and mild throughout the Northwest with a free movement of produce. Wheat is disappointing, as a large percentage of the crop has been badly injured by continuous rains during September and October. This has demoralized the market and checked deliveries, as millers and dealers have no faith in the keeping qualities of the grain. The country cannot rely on any large amount of milling wheat from the Northwest—millers here cannot procure a full supply. Lumber market will be quiet until after New Year's.....

Omaha, Neb.: Country roads now in good condition. Poultry scarce and high-priced. Grain and produce have advanced slightly.....San Francisco, Cal.: Copious rains are now falling throughout the State. Pork products lower. Rice going up. Heavy exports of wheat at dull, declining rates. Sales of shipping wheat 7½ per ceutal below last week's quotations.....Baltimore, Md.—Corn and wheat too high for exportation. Market for spot cotton dull and weak. Wheat inactive and prices lower. Southern corn in active demand at steady prices; Western dull and lower. Fruit market very active on account of approaching holidays.....Wilmington, N. C.—Weather cold and rainy. Cotton firm. Spirits of turpentine and resin advancing. Provisions steady.....Charleston, S. C.—Cotton receipts good. Weather now quite cool.....Savannah, Ga.—Cotton for the week has been quiet, but a number of brokers have been forced to sell, owing to stringency in the money market. A fair demand for better grades; lower neglected and accumulating. Rice supply limited; prices keep up still.....Augusta, Ga.—All cotton factories running on full time with orders ahead. All of the $1,000,000 capital of the King Cotton Manufactory has been subscribed. Cotton continues to come in rapidly; receipts since September 1, 118,230 bales against 141,080 bales at the same date last years. Money still tight in town and country places.....Memphis, Tenn.—Produce and provision markets well supplied; indications of a decline in prices.....Nashville, Tenn.—Receipts of cattle very light, with scarcity of good grades. Hog market considerably depressed; weather too warm for packing. Feathers have advanced to 48c. Eggs 28c. from first hands. Limited demand for wheat at steady figures. Collections fair.....

An association of St. Louis millers has purchased a large wheat farm in Dakota, and propose to raise their own wheat, instead of buying from middlemen. The project seems feasible. The Chicago Inter-Ocean commends the project, and hopes that millers in other localities will adopt it. The danger is pointed out that the farm business of a great association will not be managed as well as it would be by a single farmer.....Florida oranges will soon be plentiful. The crop this year is stated to be larger than ever, and the quality superior. None have been injured by frost. The Palatka Journal of a late date, shows that 8,283,000 are produced in its district alone, and says: "This is clearly the bearing year for this section. The yellow *pommes* of Florida may substitute in some degree the usual supply of apples at the North..... Before the civil war the exports of pecan nuts from Indianola, Tex., were reported at $100,000; now it is estimated that the amout annually gathered exceeds $2,000,000 in value. But little care, however, has been taken of the trees; in fact, in many localities, trees 50 to 100 years old have been cut down to secure the nuts. With proper care of the treee and systematic gathering of the crop, it is believed that $10,000,000 could be annually realized.....Holland is shipping kraut to the United States by the ton; 2,000 barrels reached this country last month. The occasion is this year's short cabbage crop. Cars that last year were unloaded here with 4,000 head of cabbage now hold 12,000, so much smaller is the growth. The quality of cabbage which is this year sought after at 25 and 30 cents a head was a drug in the market in the Fall of 1880.

The Pittsburg Sunday Leader quotes:—Mr. Martin Karg, Silver Creek, Minn., cured a badly wounded horse with St. Jacobs Oil.—*Com.*

Shan't I Take a Blue Pill?

No, don't take it and run the risk of mercurial poisons, but when bilious and constipated get a box of the celebrated Kidney-Wort and it will speedily cure you. It is nature's great remedy for constipation, and for all kidney and liver diseases.—*Adv.*

The ladies who sometime since were unable to go out, having taken Lydia E. Pinkham's Vegetable Compound, are quite recovered, and have gone on their way rejoicing.—*Adv.*

A Pure and Effective Hair Dressing.

COCOAINE, a compound of Cocoanut Oil, beautifies the hair and is sure to allay all itching and irritation of the scalp.

The superiority of BURNETT'S FLAVORING EXTRACTS consists in their perfect purity and strength.—*Adv.*

The Markets.

SPECIALS FROM THE CHIEF CENTERS.

Until Saturday, December 17.

CHICAGO.—WHEAT unsettled; No 2 Chicago Spring, $1.26½@1.27 cash; $1.26¾, December; $1.2?¾, January; $1.28⅜@1.28¼, February; No. 3 do. $1.12½; rejected, 80@86c. CORN fairly active at 60¾@61c. cash; 60¾c. December; 61@61½c., January; 61⅝@61⅞c., February; 67⅝@66¾c., May; rejected, 59c. OATS fairly active and a shade higher at 46¼c., cash and December; 44⅜c., January; 44⅝., Febrnary; 46⅝@46¾c., May. FLAXSEED $1.34@135. PORK unsettled. Old, $16.50: New. $16.87½, cash and December; $16.80@16.82, January; $17.02½, February; $17-25, March. Lard active but a shade lower at 10.90@10.95c., cash; 11.07½@11.10c,, January; 11.22½c., February; 11.37½@11.40c. March. Bulkmeats easier; Shoulders; $6.25; Short Rib, $8.85; Short Clear, $9.11. HOG market generally weaker, except for choice; light bacon sold at $5.90@6.05; common to good mixed weak and prices 5@10c. lower at $5.70@6.20; heavy packing and shipping, $6.25@6.65, including Philadelphias and lard hogs; skips and culls, $4@5.25. CATTLE market dull, weak and 10c. lower than yesterduy, few Christmas cattle offered; quotations nominal at $7@7.50; exports, $6@6.65; good to choich shipping, $5.15@5.60; common to fair, $4@5; Mixed butchers' steady; poor to good cows, $2.25@$4; bulls $2.50&4; oxen, $3.50@4.50; Texans nominally $3@4.35. SHEEP market steady generally firm; common to medium, $2.75@3.50; good to choice, $4@5. Extra, $6.

CINCINNATI.—WHEAT dull; No. 2 Red Winter, $1.36@1.37. CORN firm; No. 2 Mixed, 64½@65c. OATS firm; No. 2 Mixed, 49c. RYE dull at $1.05½. BARLEY dull at $1.05. PORK dull at $17@17.25. Lard dull at 10.90c. Bulkmeats heavy; Shoulders, 6¾c.; Clear Rib, 8¾c. Bacon dull and unchanged. HOGS.—Common and Light, $5@6.10; Packing and Butchers', $6@6.50. BUTTER—Fancy creamery sells at 40@41c.; good to prime do., 33@38c.; fancy dairy, 28@30c.; prime to choice Western Reserve, 25@28c.; medium do., 20@23c.; prime to choice Central Ohio, 20@23c.; common, 15@18c.; inferior 12@13c. per pound. CHEESE has been in light demand all the week, but prices are firm for prime to choice factory at 11½@12½c. per pound. EGGS.—

The receipts have been light and prices have advanced to 31c. per doz. for fresh. HAY.—The receipts have been large, and prices rule lower. Common mixed sells at $15@17, and No. 1 Timothy at $17@18 per ton in bales on arrival; prairie hay sells at $13; wheat and rye straw is easier at $10@11, and oats straw at $11 yer ton. HEMP.—There is little offered, but the demand is light for rough and fair for dressed. Rough Kentucky sells at $125 per ton on track; singled dressed sells at 8½@9c., and double do. at 10@10½ per pound from store. MILL FEED.—The receipts are scarcely equal to the demand and prices are higher. Bran sells at $20.50; shipstuffs at $21@22, and middlings at $23@28 per ton in bulk, and 50c. more in sacks on track.

ST. LOUIS.—No. 2 Red Fall Wheat, $1.33½, cash; $1.35½, January; $1.38⅝, February; $1.40¼, March; $1.43⅝, May; sales at $1.35¼, January; $1.38, February; $1.40, March; $1.43¼, May. CORN steady, but slow at 62⅞c., cash; 64⅜c., January; 65⅝c., February; 66½c., March; 68¾c., May. OATS, 47½c., cash; 47¼c, January; 47¾c., February; 50c., May. RYE slow at 98c. bid. PORK and bulk meats very dull, and nothing doing. Bacon lower; shoulders, 7½c.; clear rib, $10.10; clear sides, $10.20. Butter and eggs nominally unchanged. CATTLE—Demand fair for good butcher stock and feeding steers, but other grades slow; medium to choice butcher's steers, $3.75@4.90; good cows and heifers, $3.50@4; do., Texans and Indians, $3.50@4; feeding steers, $3.40@4; shipping steers scarce and demand light; medium to fair, $4.57@5.25. Sheep—Good to fancy muttons wanted at $4@5; low grades slow. HOGS—Yorkers higher; other grades unchanged; very light, $5.25@5.50; Yorkers, $5.90@6; packing, $6.30; butcher's to fancy, $6.35@6.70.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Dec. 17, 1881.

BEANS AND PEAS.—A confident feeling prevails for standard white beans. The new and stronger prices have produced some feeling of caution on the part of buyers, but rates as a rule are supported for all whites. Red beans quiet, but well held.

Green peas generally quiet; $1.65 in bbls. and $1.50 in bags. Southern B. E. peas $3.25@3.40 ₱ 2-bush bag, mostly ordered.

Beans, marrow, prime, $3.52½@3.55; fair to good, $3.25@3.45; medium, choice, $3.25; fair to good, $3@3.20; pea, choice, $3.25; fair to good, $2.90@3.05; white kidney, choice, $3.45@3.50; fair to good, $3.20@3.35; red kidney, choice, $2.85; fair to good, $2.50@2.80; turtle soup, $1.75@1.80.

Peas, green, prime, in bbls., $1.65; green, in bags, $1.50@1.55; Southern b. e., per 2-bu. bag, $3.25@3.40.

Receipts of beans for the week, 6,770 bush.

Exports do. 488 bbls.

BUTTER.—High rates at the West for Elgin have given that brand a special place in the market, and 42@45c. is quoted. Of other styles of Western creamery and half tubs there is a free offering and prices are regarded as very full, never in a large way reaching the extremes. Westerns is running so close to State that it receives no special attention. The demand is so purely local that sellers have to humor trade more or less as there is no outlet in a foreign way.

Creamery, fancy, 44@45c.; choice, 40@42c.; fair to good 35@39c.; ordinary, 28@34c.; State half firkins, fancy, fresh, 34@35c.; choice, 32@33c.; prime, 28@32c.; fair to good, 23@27c.; firkins, choice, 31c.; fair to good, 25@30c.; ordinary, 20@22c.; State dairies, entire choice, 31@32c.; fair to good, 27@30c.; State Welsh tubs, choice 33c.; fair to good, 29@31c.; Western imitation creamery, 28@30c.; dairy choice, 32@33c.; good to prime 25@31c; ordinary to fair 18@22c.; special marks, June 16½@17c.; prime to choice do. 15@16c.; choice, current make, 20@22c.; fair to good do. 15@18c.; inferior 12@14c.

Receipts for the week, 25,533 pkgs.

Exports do. 1,542 do.

CHEESE.—Fancy factory is held with more confidence. Shippers are well filled up, but at this season the local wants are apt to run upon a better style of cheese than usual and consequently some parcels are held a shade above 12½c. There is a fair trade in good skims.

State factory, fancy, 12½c.; choice, 12@12¼c.; prime, 10½@11¾c.; fair to good, 10@11¼c.; ordinary, 9@9¾c.; Ohio, cheddar, fair to good 10@11c.; prime 10@11c., fair to good, 9@10c.; creamery part skims choice 9@9½c.; fair to good 7@8c.; ordinary, 4@5c.; full skims 2@3c.

Receipts for the week, 47,131 bxs.

Exports do. 39,600 do.

Steam to Liverpool, 54s. 6d@63s. for Summer to late makes.

COTTON.—There has been a strong and partly successful attempt to push up prices up prices this week with the basis of Agricultural Bureau report. The estimate is down to 3,000,000 bales. The condition of the crop is said to not have been so bad since 1866. Among dealers there has never been a season when opinions as to the outcome of the crop have been so varied.

CURRENT PRICES FOR SPOT COTTON.

Quotations based on American standard of classification and on cotton in store, running in quality not more than half a grade above or below the grade quoted.

Futures fairly active, closing buoyant at an advance of 12 to 17 points; sales, 165,200 bales; prices paid: December, 11.98@12.10c.; January, 12.11@12.27c.; February, 12.32@12.49c; March, 12.53@12.69c.; April, 12.70@12.88c.; May, 12.83@12.97c.; June, 12.94@13.08c.; July, 13.15c.; August, 13.15@13.26c.; September, 12.55c.; October, 11.85@11.87c.; November, 11.61@11.69c.

Receipts for the week, 46,578 bales.

Exports do. 8,912 do.

DRIED FRUITS.—No quotable variation for evaporated apples. Sun-dried easier.

Apples, evaporated, rings, f'y 13½@14c.; fair to prime, 11@12c.; N. C. new, sliced, fancy, 7½@8c.; fair to choice, 6@7c.; Southern quarters, choice, 6¼@6¾c.; Southern, fair to good, 5@5¾c; do. ordinary, 4½@5c.; State, old, fine-cut, choice, 6@6¼c.; quarters, do. 5¾@6c.; small lots, 6@6¼c.; Ohio and Mich. choice, 5¾@6c; Western, fair to good, 3¾@6¼c. Peaches, evaporated, peeled, old, 35@37c.; unpeeled, new, 16@—c.; N. C. peeled, fancy, 22@23c.; choice, 20@21c.; Ga. 20@21c.; Southern, peeled, fair to good, 16@18c.; unpeeled halves, 6½@7c.; halves, Tenn. 6c.; quarters, 6¼@6½c.; Plums, State, black, 16@17c.; St'n Damson, 13½@14c. Blackberries, 13c. Cherries, Southern, dry, 18@20c. Raspberries, pr 27@28c. Huckleberries, pr 14@15c.

EGGS.—Receipts are light, and though trade is not sharp the weather gives sellers considerable independence, and prices are steady.

Choice stock, ₱ doz. 33@34c.; State and Pa. 30@31c.; Western, choice, fresh laid, 28@29c.; do. and Canadian fine, held, 26@ 27c.; Southern, fresh fine, 27@29c.; Western, Southern and Canadian, fair to good, 24@ 26c.; limed eggs, State, 23@24c.; Canada and Western, prime, 22@23½c.; fair to good, 21@22c.

FLOUR.—The close of the year is usually a dull time for high grades of flour, and this date is no exception. Receipts are largely composed of family brands, and in the endeavor to make prompt sales the market is declining. Export sorts not plenty and are making steady quotations. Buckwheat flour scarce and tending higher.

No. 2, per bbl., $3.40@1.45; State and Western, superfine, $4.40@4.90; city mills, XX, $6.90@7.35; Spring wheat, extra, $5.00@5.35; Spring XX and XXX, $5.50@6.75; patents, $6.50@8.50; Ohio round hoop shipping, $5.25@5.65; trade brands, $5.75@6.50; St. Louis extra, $5.40@5.90; do. double extra, $6.10@6.50; do. family, $6.65@7.25; Southern extra shipping, $6.00@6.40; do. XX and family, $6.50@7.50. Rye flour, superfine, $4.75@5.10; buckwheat flour ₱ 100 lbs. $3.60@3.90. Cornmeal, Brandywine, ₱ bbl. $3.75@3.85; do. Western, $3.35@3.75. Wheat feed, 40 ℔ ₱ ton, $19.00@20.00; 60 ℔ ₱ ton, $20.00, 100 ℔ ₱ ton $31.00@25.00.

Receipts of flour for the week, 42,958 bbls.; cornmeal, 3,750 do.

Exports of flour for the week, 42,960 bbls.; corn-meal 4,200 do.

FRESH FRUITS.—Large quantities of apples have saved badly, and there is a large offering of inferior or spotted in market. Prices irregular for all but fine stock; this is not pressed for sale. Virginia shipping some costly Albemarles to Europe. Cranberries extremely firm, and extra hard Eastern fruit is tending higher. Grapes have little inquiry. Fine Florida oranges are in demand. Buyers prefer to pay top rates for holiday purposes.

Apples, Spitzenberg, ₱ bbl. $3.50@4.50; Greening, fancy, $3.50@3.75; Baldwin, do. $3.50; Seeks, prime, $3.25@3.50; Baldwin, Greening and Seeks, fair to prime, $3.00@3.25; Northern Spy, prime, $3.00@3.25; Russet, prime, $3.00; seconds, $1.75@2.00. Lady apples, choice clear, ₱ keg, $1.00@6.00; poor to good, $1.50@3.00. Pears, Boston, bush. boxes, poor to good, $1.50@3.50; Vicar of Wakefield ₱ bbl., $2.50@3.00; Grapes, Catawba State, case of 18 3-lb. bxs, 3.00@3.00; baskets, ₱ lb., 6@8c. Florida oranges, half-bbl. boxes, choice, $4.00; good to prime, $3.25@3.75; inferior, $2.50@2.75; thirds, choice, $2.75; fair to prime, $2.25@2.50; inferior, $1.75@2.00. Cranberries, Cape Cod, fancy, large, ₱ bbl. $12.50@13.00; good to choice, $10.00@12.00; inferior, $6.00@8.00; ₱ crate, $3.25@4.00; Jersey, choice, ₱ crate, $3.25@3.50; fair to prime, $2.75@3.25; poor to fair, $2.25@2.75; frosted, 75c.@$1.

Peanuts in very small supply and higher. Pecans firm. Hickory nuts quiet. Black walnuts in small supply; few are wanted.

Peanuts, Va., hand-picked, ₱ lb. 7½@7¾c.; fancy, 7c; extra prime, 6¾@6¾c.; good to prime, 6¼@6½c; shelled, 5@6c.; pecan nuts, 10@12c.; hickory, shell, bark, Northern, ₱ bu. $1.00@1.25; Western, $1.00; bull nuts, 40@50c.; black walnuts, 50c.

GRAIN.—Supplies at all points of collection continue to be light, and with a good export call prices have a stronger tendency and close fairly firm. The visible supply 1,000,000 bushels less than last week. Corn is 1,800,000 bushels less in sight than a week ago, and prices rule strong with a trade for use. Oats have a fair demand and prices tend easier.

Wheat, Spring, $1.25@1.38; Spring No. 2, $1.32@1.37; red Winter No. 2, $1.40@1.42; red Winter, $1.35@1.41; white Western and State, $1.32@1.41. Rye, 91c.@97c. Oats, white No. 1, 51¾@52c.; No. 2, 50½@51c.; No. 3, 50c.; mixed, No. 1, 50@51c.; No. 2, 49½c.; No. 3, 47@48½c. Corn, Western, mixed, 66@70¼c.; do. No. 2, 69¼@70¼c. yellow, 69@71c.; white, 72@73c. Barley, Canada, No. 1, $1.09@1.10; do. "bright," $1.12@1.14; State, 4-rowed, 95c.@$1; 2-rowed, 80@85c. Buckwheat, $1@1.02.

Receipts for the week, wheat, 399,350 bush.; corn, 363,567 do.; oats, 125,950 do.; rye, 70,492 do.; malt, 52,400 do.; barley, 112,850 do.

Exports for the week, wheat, 395,507 bush. corn, 263,299 do.; oats, 1,775 do.

The visible supply of grain, comprising the stocks in granary at the principal points of accumulation at lake and Atlantic ports, and on rail, on lakes, on canal and on Mississippi River:

	1881. Dec. 3. bush.	1880. Dec. 11. bush.	1879. Dec. 13. bush.
Wheat	18,876,107	28,673,491	27,688,539
Corn	18,817,521	15,257,056	10,079,363
Oats	2,820,045	2,816,749	2,612,661
Barley	3,165,971	2,963,941	4,730,815
Rye	1,253,216	932,633	1,161,970

HAY AND STRAW.—Supplies are large and prices are weak. Fancy Jefferson Co. may make $1.05, but there is an abundant offering of useful retail at $1.00. Straw in fair demand.

Hay, retail quality, fine, ₱ 100 lbs., 95c.@$1.05; do., fair to good, 80@85c.; shipping quality, 60@70c.; clover mixed, 70@80c.; clover, 60@65c. Straw, best, 70@80c. ₱ 100 lb; short rye, 55@60c.; oat and wheat, 40@50c.

HONEY.—Quotations are:

White clover, fancy, 1-lb bxs, ₱ lb., 19@20c.; do. 2-lb bxs, 17@18c.; good to choice, 1@2-lb bxs, 15@17c.; buckwheat, 1-lb bxs, 14@15c.; 2-lb bxs, 12@14c.

HOPS.—A fair amount of business exists, but no spirit to operations on the part of any class of buyers. Cable advices from London report an active business there on the basis of previous prices. The bulk of American hops there is understood to have been taken up, and the prospects are considered favorable for higher figures after the holidays, providing no extensive amounts are shipped from this market in the meantime. We hear of considerable buying at interior points, with prices paid above what most dealers claim can be obtained here; besides this, the interior holders are said to be displaying more firmness.

New York State crop of 1881, prime to choice, 26@30c.; do., mediums, 23@25c.; do., low grades, 20@22c.; do., 1880, good prime, 18@22c.; do., low to fair, 12@15c.; do., 1879, fair to choice, 16@20c.; do., olds, 7@15c.; Eastern, crop of 1881, fair to choice, 20@26c.; Wisconsin do., 20@27c.

MILK.—Most of the common cans have sold on plat form at $2 per can of 40 quarts. Demand not sharp.

POULTRY AND GAME.—It has been a low, unsatisfactory week for dressed. The market has been so glutted with poor or stale stuff that shipments this way had to be discouraged. The weather has improved and shipments of fresh stock may improve.

Turkeys, Phila., choice, dry picked, 14c.; Jersey, choice, 13@13½c; State and Western, choice, 12@13c.; fair to good, 8@10c.; poor, 5@6c.; Chickens, Phila., 12@14c.; do., small, 11@13c.; Jersey, choice, 11@12c.; State and Western, 10c.; scalded, poor to fair, 3@7c. Fowls, mixed State and Western, 8@10c.; Bucks Co. and New Jersey, prime, 11c.; Long Island and New Jersey, fair to good, 9@10c.; Phila. dry picked, prime, 12@13c.; State and Western, 8@10c.; do., poor to fair, 8@9c.; old roosters, ₱ lb. 4@5c. Ducks, Phila., ₱ lb, 13@14c.; State and Western, choice, 12@13c.; do., fair to good, 8@10c. Geese, Phila., choice, 12@14c.; State and Western, prime, 10c.

Live poultry is not wanted.

Spring chickens, large Jersey, 8@9c.; do., light, 7@8c.; Western, ₱ lb, 7@8c. Fowls, Pa. and Jersey, ₱ lb, 8@9c.; State, 8c.; Western, ₱ lb, 8c. Roosters, old, ₱ lb, 4@5c. Turkeys, Jersey and Pa. ₱ lb, 8@10c.; Western, 7@8c. Ducks, State, Pa. and Jersey, ₱ pair, 50@70c.; Western, ₱ pair, 40@50c. Geese, Western, ₱ pair, 90c.@$1.12; State, Pa. and Jersey, ₱ pair, $1.25@1.50.

Game is in good demand and prices have favored sellers.

Quail, choice, ₱ doz. $2.50@2.75; small and soft do. $1.50@2; prime undrawn, ₱ pair, $1@1.12; grouse, prime undrawn, ₱ pair $1.00@1.12; drawn, 80@90c.; partridges, State and choice Western, ₱ pair, 90c.@$1; Eastern and ordinary Western, 60@75c.; wild ducks, canvas back, ₱ pair, $2@3; red-head, 75c.@$1; mallards 40@90c.; teal and wood, 35@50c.; common, 25c.; venison Minn. short saddles, ₱ lb. 15@16c.; other Western and State, 13@14c.; whole deer, 10@12c.; rabbits, ₱ pair, 30@40c.; hares, 40@45c.

PROVISIONS.—French reports look glowing, in fact many parcels of bacon bought on French and Continental account have been turned on our market for resale. This is a bad feature as the English trade is comparatively at a pause. Lard is quiet and the general tone of hog products is easy.

Pork, West. mess, old, ₱ bbl. $17.00@17.25; do. new, $17.75@18; prime mess, $16@16.50; extra prime, $13.00@14. Lard, steam Western, ₱ 100 lbs., $11.17½@11.20; pr city, $11.10@11.12½. Hams, smoked city, ₱ lb. 12@12½c.; pickled Western and city 9½@10c. Shoulders, smoked city, 8@8½c; pickled, 7@7½c. Rib bellies, pickled, 9@9½c. Bacon, long clear Western, 9¼@9½c. Beef, Western mess, ₱ bbl. $12; packet, $14.50@15.00; India mess, ₱ tce. $25@26.50. Beef hams, ₱ bbl. $21@21.50.

Receipts for the week—Beef, bbls. and tcs. 1,621; pork, bbls. 8,911; cut-meats, pkgs 36,850; lard, do. 27,410.

Exports for the week—Beef, bbls. and tcs. 2,917; pork bbls. 4,025; cut-meats, lbs. 6,852,638; lard do. 1,899,141.

VEGETABLES.—Potatoes strong and firm.

Potatoes—Early Rose, N. S., ₱ d.-h. bbl., $3@3.25; bulk, ₱ bbl. $2.75@3; State, ₱ d-h bbl $2.87@3.12; bulk, per bbl, $2.75@3.00; Prolific, N. S. per d.-h. bbl, $2.75@2.87; bulk ₱ bbl. $2.50@2.75; Snowflake, State, ₱ d.-h. bbl. $2.75@3.00; bulk, ₱ bbl. $2.62@@2.87; Burbank, ₱ d.-h.bbl. $3@3.12; bulk, ₱ bbl, $2.87@3.00; Peerless, bulk, ₱ bbl., $2.50@2.75; Mercer P. E. Island, ₱ bbl. $1.50@2.25; sweet potatoes, Va. yellow, ₱ bbl. $3.75@4; Del. River, $4.50@4.75; Jersey, ₱ bbl. $3.50@4.00; Inferior, $2.50@3.25.

Good quality garden stuff steady. Many off-grade lots arrive since high prices have been current.

Onions, white bulk, ₱ bbl. $2.50@3.50; yellow, $2.00; red, east, $2.00; red Chester, $1.75@2.00; squash, L. I. ₱ bbl., $2.50@3; State Hubbard, $1.75@2; cabbage, ₱ 100, $8@18; beets, L. I. ₱ bbl. $2@2.25; carrots, $1; turnips, Russia, L. I. $1.75@2; do, Canada, $1@1.50 cauliflower, fancy, $5@7; average quality, $1.75@2.50; inferior, 50c@$1; celery, ₱ doz. bunches, $1.00@1.75.

WOOL.—There are no new features and prices are nominally firm for all fine domestic. No trade if moment expected until the New Year sets in.

LIVE STOCK MARKETS.

NEW YORK, Saturday, Dec. 17, 1881.

BEEVES.—Receipts for the week, 12,340 head; do. last week, 12,135do. The offerings on the market were rather more than butchers wanted, and the yards were not clear at a late hour. The extreme range for very poor to premium cattle was from 6c to dress 55 lbs to 14c to dress 60 lbs, with the greater part of the sales at 8¼@12½c to dress 55@58 lbs, and includes common to choice.

COWS AND CALVES.—Market dull and lower. Good cows $35@60; prime to fancy, $65@75.

SHEEP AND LAMBS.—Receipts for the week, 28,375 head; do. last week, 28,285 do. Very little trade at either market place. Butchers want to work off the stock which has accumulated on their hands before making fresh purchases, and the few odd lots bought yesterday were to fill out prompt wants. Should the run continue light through next week, as now seems probable, a further improvement is inevitable. Sixty-two choice Ohio sheep, 152 lbs average, sold at 6½c.; otherwise the range for sheep was from 4 to 5½c, and for lambs from 5¾ to 6¾c.

SWINE.—Receipts for the week, 29,206 head; do. last week, 36,300 do. Market in good form, as the local demand is brisk for light hogs.

Hogs, New Jersey dressed, light, 8¼@8¾c.; medium, 8@8¼c.; heavy, 7½@7¾c.; city dressed, 7¾@8c.; live hogs, corn-fed, ₱ 100 lbs, $6.20@6.40; pork tenderloins, ₱ lb, 7@9½c.

VEAL CALVES.—Market lightly supplied and all choice live or dead doing well.

Hog-dressed, choice, 12@12½c.; dressed, fair to good, 10@11½c; do., grass, 5@6c; live calves, N. J. prime to choice, 9c.; do. State, 8½@8¾c.; fair to good, 7½@8c.; poor to fair, 6@7½c.; Mount Hollys, 160 to 220 lbs 8½@9½c.; 220 to 280 lbs 7½@8½c.; 280 to 400 lbs 5½@7½c.; live calves, fed, 4@4½c; grass, 2¾@3½c

A Bargain!

THE

OHIO FARMER

AND THE

RURAL NEW-YORKER.

BOTH PAPERS ONE YEAR

FOR ONLY THREE DOLLARS!

THE OHIO FARMER, published at Cleveland, Ohio, is one of the oldest and very best Agricultural and Family Journals of America. It has been established thirty-five years, is a 16-page, 64-column weekly, with frequent 16-column supplements, giving to its readers nearly 900 columns of the most valuable, reliable, interesting and instructive matter in a year, at only

$1.50 PER YEAR, POSTAGE PAID.

THE OHIO FARMER is a thoroughly practical Agricultural Journal, containing each issue about one hundred articles written expressly for it by actual, practical, successful Farmers, Horticulturists, Thoroughbred Stock Breeders, etc. It aims to give actual instruction from reliable sources, that any farmer can understand and put into practice. It is

Acknowledged Authority on all Agricultural Topics,

and is conducted by an able and experienced Editorial Management, who spare no expense or labor to add everything possible to its value.

THE OHIO FARMER has now a paid list of **over 35,000** subscribers, which is unquestionable evidence of its value to the intelligent farmers of the country.

THE RURAL NEW-YORKER, with Free Seed Distribution, and THE OHIO FARMER will both be sent one year for **only $3.00**, which is only about the price either one ought to be offered at. This is a bargain to any farmer who wants the BEST agricultural papers of this country.

U. S. Wind Eng. & Pump Co., Batavia, Ill.

One Chance in a Life-time! Read this Offer!

TWO PAPERS ONE YEAR FOR THE PRICE OF ONE AND SIX VALUABLE AND USEFUL PREMIUMS FREE! The Greatest Offer Ever made by a Reliable House! Wishing to introduce our two charming family periodicals, **The Household Gazette** and **The Rural Home Journal**, into every household in the United States where they are not already taken, we make this grand unparalleled offer: Upon receipt of **only One Dollar** (the regular price of *The Household Gazette* alone), we will send **Both Papers for a Whole Year**, and in addition we will also send, **Free** and post-paid, **Six Useful and Valuable Premiums**, as follows: 1. **Ladies' Gold-Plated Necklace.** This is not a cheap, worthless brass affair, but is of a good quality of gold plate, and durable; it is of a new and stylish pattern, and any lady would be proud to wear it. 2. **Handsome Panel Picture and Easel**, something entirely new and a very attractive and stylish mantel ornament; the picture is beautifully executed in many colors, and the easel is of fine oxidized wood. 3. **Gold-Plated Ring**, for lady or gentleman. A plain half-round ring of good, substantial gold plate, which will stand the test of jewelers' acids, and is entirely durable. 4. **Package of Honey-Comb Spirals**, a new material for making fancy articles for home decoration; the package consists of 125 Spirals, with coil of wire, directions, diagrams, etc. 5. **Microscope, Locket and Watch Charm Combined**—a good microscope for examining insects, fluids, etc.; a Locket for holding pictures, and a Charm for your Watch-chain, all combined in one. 6. **The Musical Wonder**, a simple yet wonderful little musical instrument, upon which any tune may be played, and birds, beasts, etc., imitated. These six articles, packed in a neat box, will all be sent *free* by mail, post-paid, to every one sending one dollar for a year's subscription to our two papers. In addition, in one premium box in every 25 we shall place an extra grand premium of a *Solid Gold Turquoise Diamond Ring*; in one premium box in every ten we shall place an extra grand premium of a *Pair of Parisian Diamond Ear-Drops*, rolled gold mountings; and in one premium box in every five we shall place an extra grand premium of a *Parisian Diamond Stud*, rolled gold mounting. Every subscriber will receive the two papers one year and six premiums for one dollar, and 35 subscribers in every 100 will receive one of the extra grand premiums. Our two papers are among the largest, handsomest, and best published. THE HOUSEHOLD GAZETTE is a large 16 page, 64-column Literary and Family Paper, devoted to pure and entertaining Literature, Romance, Useful Knowledge, Poetry, Wit and Humor, Reading for the Young, etc. THE RURAL HOME JOURNAL is a large 8-page, 32-column Illustrated paper, devoted to Agriculture, Horticulture, Household Topics, Practical Recipes, Ladies' Fancy Work, Stories, Exposure of Humbugs, etc. These papers are just what is needed in every family for amusement, entertainment and instruction. This is the greatest and most liberal offer ever made by any publisher in the world! None should fail to take advantage of it! We guarantee every one **Twice the Value of Money Sent**; and those who receive the extra grand premium will receive even more, and *to all who are not perfectly satisfied, the money will be cheerfully returned.* Our premiums are all of genuine value and usefulness, guaranteed as represented, and the papers are first class in every respect. As to our reliability, we refer to any publisher in New York, likewise to the Commercial Agencies, as we have been long in business, are well known and have an established reputation. Now is the time to secure this unparalleled bargain! To any one who will show this advertisement and get up a club of five, we will send an extra subscription, with the premiums, free! Address,

F. M. LUPTON, Publisher, 27 Park Place, New York.

For the Young.

THE BABY'S PETITION.

ANNIE L. JACK.

THE baby has seen but one Christmas,
And now she is trying to walk;
But her steps are as slow and uncertain
As is her endeavor to talk.
But she knows—for the little ones told her—
(How soon children *do* understand),
That the kind Christmas saint is soon coming
To fill stockings all over the land.

So she fights with her nurse every morning,
And covers her dear, chubby feet,
Holds tightly the gay colored stocking
No matter how much we entreat.
We wonder at curly-head's meaning
Till one day the chimney she sees,
And shouts with her wide-opened stocking,
"Bing sumfin, dood man, if 'oo please."

It was only a baby's petition,
And passed with a tear and a smile;
The sweet infant graces of childhood
The coldest of hearts can beguile.
But it touched on a cord in our being
The thought is so truly our own,
When we reach out our hands for a "sumfin."
And ask it in prayer at the Throne.

THE COLD, COLD SNOW.

THE cold, cold snow! the snow that lies so white!
The moon and stars are hidden, there's neither warmth nor light;
I wonder, wife—I wonder, wife—where Jeanie lies this night!

'Tis cold, cold, since Jeanie went away;
The world has changed, I sit and wait, and listen night and day;
The house is silent, silent, and my hair has grown so gray;
'Tis cold, cold, cold, wife, since Jeanie went away.

And tick! tick! tick! the clock goes evermore;
It chills me, wife—it seems to keep our child beyond the door!
I watch the firelight shadows as they float upon the floor,
And tick! tick! tick! wife, the clock goes evermore

'Tis cold, cold, cold!—it were better she were dead,
Not that I heed the minister, and the bitter things he said,—
But to think my lassie cannot find a place to lay her head;
'Tis cold, cold, cold, wife—better she were dead!

The cold, cold snow!—the snow that lies so white!
Beneath the snow her little one is hidden out of sight:
But up above the wind blows keen; there's neither warmth nor light;
I wonder, wife—I wonder, wife—where Jeanie lies this night!

DAISY'S YEAR IN SOUTHERN CALIFORNIA.

ALICE P. ADAMS.

Up the Coast.

SAN GABRIEL, Cal., Nov. 8, 1881.

MY DEAR MOTHER: We have just come back from the nicest kind of a trip, and I will tell you as much as I can about it in this letter. Mr. Erman found that he was obliged to go to Santa Barbara on business, and as none of us except his wife had ever been there, and he dislikes to travel alone, he agreed to take us all with him if we would "be good." Violet and I promised immediately, but you must correspond with Mr. Erman if you would know how we "kept the faith." I am certain we were not very *sober-minded*. I am losing all my reputation for dignity, but there is so much to enjoy here that I cannot "preserve a calm and unruffled demeanor," as the precise Miss Briggs would say.

Santa Barbara is 110 miles from Los Angeles, making it nearly 120 from here. Mr. Erman drove us up in the spring wagon, (which is one of the completest carry-alls I ever saw) and Bert rode his pony. We started early Monday morning, and reached Los Angeles before half the city had finished their breakfast. Such a drive as we had the first day! Sixty miles! and then the horses did not seem very tired! They are quite small, but appear to be very tough, and Mr. Erman says they can travel further and endure more than large American horses.

The scenery we passed through is quite different from that about San Gabriel. Here the hills and mountains inclose a broad valley, but there were hills and hills—nothing else. We were riding "among the hills," as some one remarked, and immediately Mrs. Erman repeated several verses from Whittier's poem. (I mean to read it as soon as I finish my letter.) Some of the steep hills Violet and I walked up, for it was a pretty heavy pull for the horses. I remember the first long hill we went down. The road was cut out at the side, and wound in and out so that you could only see a little way ahead. It was very narrow, usually just wide enough for a single track, but every now and then were places where teams *could* pass if necessary.

We met four going down that one hill—great six-horse teams carrying loads of grain to Los Angeles. Mr. Erman had the outside track, so each time he had to get the wagon out as far over the edge as he possibly could, and hold the horses' heads while the great wagons came creaking by us; and the Mexican drivers usually took occasion to crack their long whips when about even with us, causing our horses to shy and start. I thought once that wagon and all would go down over the steep precipice.

They had considerable sport at my expense, for there was a mule tied behind one of the loads, and I was afraid of him and crawled down the bank as far as I could to be out of harm's way. And the animal appeared equally frightened, for he tried to climb the hill which rose up from the road like a perpendicular wall. Failing in this, he slunk around behind the wheels, and I believe he was more scared than I—though the rest do not agree with me.

After awhile the hills separated and we drove through valleys again. For miles the road lay through a beautiful park—Newbury Park I think it is called—and the whole section is a vast wheat field. It seemed strange to sow grain where there are so many trees. Live-oaks they were—just like these at San Gabriel but some of them were covered with gray-green moss; I never saw anything like it before. The branches were draped and festooned, and the moss hung down for over six feet from some of the limbs. Mrs. Erman says it is formed by the action of the sea-air. Whatever is the cause it makes the trees look much prettier, and I wish it grew on all the oaks. We brought some back with us, and Mr. Erman found me an especially nice piece that I expect you will see some day, for I put it with the rest of my *curiosidads*. (Please take notice that I am studying Spanish.) We spent the first night at a country hotel in the Conejo (Co-nay-ho,) which being interpreted is "The Rabbit Ranch." We didn't see any rabbits, and I think the name ought to be changed to something that would mean the abiding place of *roosters*, for I hope that I may never again listen to such crowing as I heard there, as Violet and I (especially I,) were dreadfully tired and cross, and those miserable fowls woke us up before daylight, and it was impossible to get another wink of sleep I hoped they would split their throats, but instead each note was clearer and louder than the last; so we gave up all thoughts of returning to the land of nod. And I remembered once reading of a young city gentleman stopping in the country whose morning nap was disturbed by roosters, and he told the farmers people that they "raised the early crocus!"

The next day's ride of 30 miles to Ventura was not as pleasant. We came down a very long, steep mountain grade; all walked, and Mr. Erman put on the brake as far as he could, and tied the hind wheels of the wagon, and we reached the foot without any accident.

I saw a wonderful old man's face on the mountain side. It looked like the head of a giant, and the features were perfect—particularly the long nose and flowing beard. I pointed it out to the others and they all saw it plainly. After that I was continually finding faces or images, which I could see distinctly, but the rest thought I was possessed of a very strong imagination.

We passed through several settlements with peculiarly unsuitable names, for the springs at Springville were conspicuous for their absence, and of all the miserable little dirty places I ever saw New Jerusalem carries off the honors!

I think I will leave the description of Ventura and other places for another letter.

Your loving daughter, DAISY.

NOTES.

KEEP the subject of the next Discussion in mind.

A member of the Club has asked us to print some pieces suitable for declamation, so this week we give a piece of poetry entitled "The Cold, Cold Snow." In the course of the Winter we shall publish other pieces.

We are much gratified at the manner in which our attempts to profit and please, are received by the members of the Club, but especially glad to see them interested in the Discussions and in letter writing.

Lest some should think that no names will be received for the Club after Jan. 1st, I will say that we shall be glad to enroll at any time the names of any of our young friends who take a lively interest in our work.

I hope none of the cousins will be discouraged if their letters do not appear in print. Where so many are received we can publish only the best; but be assured Uncle Mark reads them all, and so knows just what each one writes. It is a good thing to have practice in composition and penmanship, and all should do the best they can to say good things in plainly written letters. U. M.

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK.—I have delayed writing to you about the seeds you sent us. My brother Robert and myself sowed them and cared for them. All have done well. We have taken much pleasure in seeing how nicely they grew, and in having something different from the neighbors near us, for none of them take the RURAL and of course, cannot have them unless we give them some. We had the best bed of celery I know of in this town and a bed of Japan Judas tree plants. My brother had quite a plot of the Dolly Dutton corn this year and the Surprise Musk Melons were excellent. We lost the Okra from frost. The pinks you sent were very handsome. We had about thirty different kinds, some double, some single, some large, and some dwarf—all handsome. We have a box of carnations in the house yet to bloom. The radish you sent two years ago we have saved and have had a good supply of seeds. We try to save all the seeds sent us so in time we will be well supplied. We would like to be classed as members of the Club if you will accept us. We will try to fulfill all requirements. I received the prize for best attendance at school last term, and the term before a prize for spelling.

Harwinton, Conn. JENNIE COLT.

DEAR COUSINS:—With Uncle Mark's permission I will write this letter to you. We are all looking forward to the Christmas week, knowing that of all the days Christmas is the children's day. We shall then expect to see many of our letters published, if Uncle Mark will be so kind, and we hope the cousins will readily respond to Uncle Mark's kind invitation to write at least twice a year. Won't we keep him busy, though, reading letters, for already there are quite an army of us. But just think of the waste paper which some of our letters may make if they are not published. However, each one must strive to write newsy letters, or they will become monotonous and uninteresting, and write only on one side of the paper. Bear in mind there are three things to look forward to; first, that Uncle Mark will surely read them; second, that some will most assuredly find their way to the waste basket, and, third, they may be published and make us surprisingly happy. P. H. B. LEIKEM.

DEAR UNCLE MARK.—I had no garden this Summer, but I had a flower-bed. It was so dry that nothing but my gladiolus bloomed. I watered all my flowers, but it didn't do any good. I wrote last January, but did not see my letter in print, and was nearly discouraged, but as you say, try, try again. I will try once more. I should like to tell the cousins about my pet cat. He is a year-and-a-half old, and is called Buff. Last Spring, after his mother was shot for catching chickens (she seemed to think them the only game fit for cats) Buff seemed to adopt the little orphan kittens, always sharing his dish of milk with them. Mamma says she has often heard him calling them in the night. Strangers who saw them supposed the group a mother and her family. EMMA L. REDRAH.

Fountain Green, Ill.

DEAR UNCLE MARK.—Papa takes the RURAL and I want to join the Club. I am a little adopted daugther, and 10 years old. My home is a good home, I love my parents and try to be a good girl. My papa is a farmer. We live eight miles from Port Townsend on Port Discovery Bay; I study physical geography and arithmetic, read in the fourth reader, and I am learning to play on the piano. I have a little vegetable and flower garden, and I have also a cow and calf, some chickens and a nice little canary bird. I have written several letters to you, but have never sent them because I was afraid you would not print them. I wish you could come out to to see us, but we are so far away. Your friend, ANNIE G. WEBBER.

Port Townsend, Washington Territory.

DEAR UNCLE MARK: I have been delighted with the letters from the cousins ever since papa commenced taking the RURAL. I am a little girl ten years old, and I am sure I should feel very proud to have a new uncle so kind-hearted as I really think Uncle Mark is. And then the seed distribution! How pleased I should be to get some nice flower-seeds. We had a nice large, orchard on our farm, but the canker worms have nearly destroyed it, as well as our neighbors' orchards, too. I was much interested in reading the discussion on house plants, for I do love plants, they look so cheerful in the windows and the vines look so pretty climbing around the house.

Cottage Grove, Wis. EMMA J. GURNEE.

UNCLE MARK.—I have wanted to join the Club all Summer. I am a little girl 11 years old. My brother Clarence takes the RURAL, which I like to read. I have been to school this Summer, and have only staid out one day. I have two flower beds of my own, and I enjoy flowers very much. I had very pretty pansies, verbenas, snapdragons, white marigolds, Princess feathers, petunias, two kinds of yellow marigolds, red Washington plant, white lilies and larkspurs.

Williamson, N. Y. LILLIE PRATT.

Miscellaneous.

MAKE HENS LAY.
An English Veterinary Surgeon and Chemist, now traveling in this country, says that most of the Horse and Cattle Powders sold here are worthless trash. He says that Sheridan's Condition Powders are absolutely pure and immensely valuable. Nothing on earth will make hens lay like Sheridan's Condition Powders. Dose, one teaspoonful to one pint food. Sold everywhere, or sent by mail for eight letter stamps. I. S. JOHNSON & CO., Boston, Mass., formerly Bangor Me

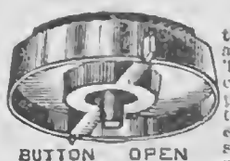
$777 a Year and expenses to agents. Outfit free. Address P. O. VICKERY, Augusta, Me.

HOPE FOR THE DEAF
Dr. Peck's Artificial Ear Drums
PERFECTLY RESTORE THE HEARING and perform the work of the **Natural Drum.** Always in position, **but invisible to others.** All Conversation and even whispers heard distinctly. We refer to those using them. Send for descriptive circular with testimonials. Address,
H. P. K. PECK & CO., 853 Broadway, New York.

80 CARDS *Elegant new styles,* Hand series, Bouquet, Friendship, Bird series, etc., 10c. Best Pack Chromo cards ever sold. For a club of 10 names we will give, FREE, 6 silver-plated Teaspoons. Agents Album full of samples 25c. Great inducements to agents. CARD WORKS, Birmingham, Conn.

12c "A Violet from Mother's Grave," & 49 other popular Songs, words and music entire, all for 12c. PATTEN & CO., 47 Barclay St., N. Y

ASTHMA *Quickly and Permanently*
CURED
Dr. Stinson's Asthma Remedy is unequaled as a positive Alterative and Cure for **Asthma and Dyspepsia,** and all their attendant evils. It does not merely afford temporary relief, but is a permanent cure. Mrs. B. F. Lee, of Belmore, O., says of it. "*I am surprised at the speedy effects of your remedy. It is the first medicine in six years that has loosened my cough and made expectoration easy. I now sleep all night without coughing.*" If your druggist does not keep it, send for treatise and testimonials to
H. P. K. PECK & CO., 853 Broadway, New York.



☞ **CUT THIS OUT, IT IS VALUABLE!** Manufacturer to the Consumer direct. Rolled Gold Separable Collar Button, also Latest Style **SEPARABLE INITIAL SLEEVE BUTTONS. SEPARABLE BUTTONS** are far superior to the old style. Our new style Separable Collar and Sleeve Buttons are patented, are easily adjusted, simple in their action, not liable to get out of order, and they overcome all trouble with stiff cuffs and we warrant them to give satisfaction. In order to secure new customers for our firm we will send **post paid,** to any address in the U. S. or Canada A pair of the above described **Sleeve Buttons, bearing any Initial desired,** and one Collar Button, as shown in illustrations, provided you **cut this advertisement out** and mail to us before **MAY 1st, 1882,** accompanied by 66 cents in Postage Stamps (22 three cent stamps). The Buttons are suitable for either Lady or Gentleman. At the same time we send your buttons we will mail you a bundle of our catalogues and feel sure that you will be so **HIGHLY PLEASED** with goods sent and that they will give such satisfaction that you will oblige us by distributing the catalogues among your friends, at the same time showing them the **Beautiful Jewelry** you have received from us, you will in this way **favorably advertise** our firm, and thus assist us in selling other goods of **standard quality,** manufactured from new designs and which we **guarantee to give satisfaction.** We can only make this liberal offer expecting our **FUTURE SALES to be OUR PROFIT.** Remember the buttons we send you are **first-class** in every respect. A more **useful or appropriate gift** for a lady or gentleman could not be obtained. Being **manufacturers ourselves** and this being the headquarters for the manufacture of jewelry in this country is one reason why we can make this **unparalleled offer,** the other is we wish to introduce our goods and catalogues in your vicinity. However we can only afford to send out a **limited number** of these buttons at price named, and in order to protect ourselves against **Jewelers** and others ordering in quantities we will insert this advertisement but **one time** in this paper, hence require you to **cut it out** and return to us with your order that we may know you are entitled to the benefit of this offer. After your buttons are received, if others are desired, we will furnish our 18 karat Solid Gold Sleeve Buttons at $6.75 per pair, or Collar Buttons at $1.50 each. In ordering state what initial you desire on sleeve buttons. **CUT THIS OUT and order before MAY 1st, 1882.** Satisfaction guaranteed. Send stamps in ordinary mail at our risk. Address, J. W. RICHARDSON & CO., Manufacturing Jewelers, North Attleboro, Mass.

Humorous.

AMBITIOUS MAN: "Is there any fixed rule for writing poetry?" There is! Don't!—Boston Post.

THE why and wherefore; "Love is blind," and that's why they managed to keep right on with the gas turned down.

THERE is a good deal of human nature in a canary bird. He always begins to chatter as soon as the piano commences to play.

"SHE stoops to conquer." Can this refer to the fond mother who bends over her wayward boy with a number-five slipper?

THERE is a whistling buoy anchored off Block Island. Oh, that all the whistling boys could be anchored in deep water far away.—Boston Globe.

THE only thing a lady dislikes about a postal card is that it is hardly large enough to allow her to show what she can do in the matter of postscripts.

AN advertisement reads: "Wanted—A young man to be partly out door and partly behind the counter;" and the Cleveland Leader asks: "What will be the result when the door slams?"

THE father of a St. Louis bride presented his son-in-law with 80,000 head of cattle. "Papa, dear," exclaimed his daughter, when she heard of it, "that was so kind of you; Charley's awfully fond of ox-tail soup."

"No, ma," said a Harlem maiden, "I don't like Charley Jones coming every night. But I don't like to tell him so yet. He is so fat and heavy that by placing my Autumn leaves on his chair I'm getting them nicely pressed."

"I WISH I were you for about two hours," she said to her husband with great tenderness. "And why, my dear?" he asks. "Because," she said, toying affectionately with his watch chain—"because then I would buy my wife a new bonnet."

A miller in Peru, Ind., fell asleep in his mill and bent forward until his hair got caught in some machinery and was yanked out; and, of course, it awoke him, and his first bewildered exclamation was: "Durn it, wife, what's the matter now.—Boston Post.

"How are you, Brown?" exclaimed Fenderson. "I have been on a regular wild goose chase, and I'm glad I've found you at last." Fenderson supposed he must have said something pretty smart the way the boys laughed, but he can't for the life of him tell what it was.

TURN TO THE LEFT.—"Is there any opening here for an intellectual writer?" asked a seedy, red nosed individual, of an editor. "Yes, my friend," replied the man of quills, "a considerate carpenter, forseeing your visit, left an opening for you. Turn the knob on the right."

A HUNGRY lawyer, who was dining at a hotel, shoveled the food into his mouth with his knife till he accidentally cut his mouth, which was observed by a wag seated opposite, who bawled out: "I say, Mister, don't cut that hole in your countenance any larger, or we shall all starve."

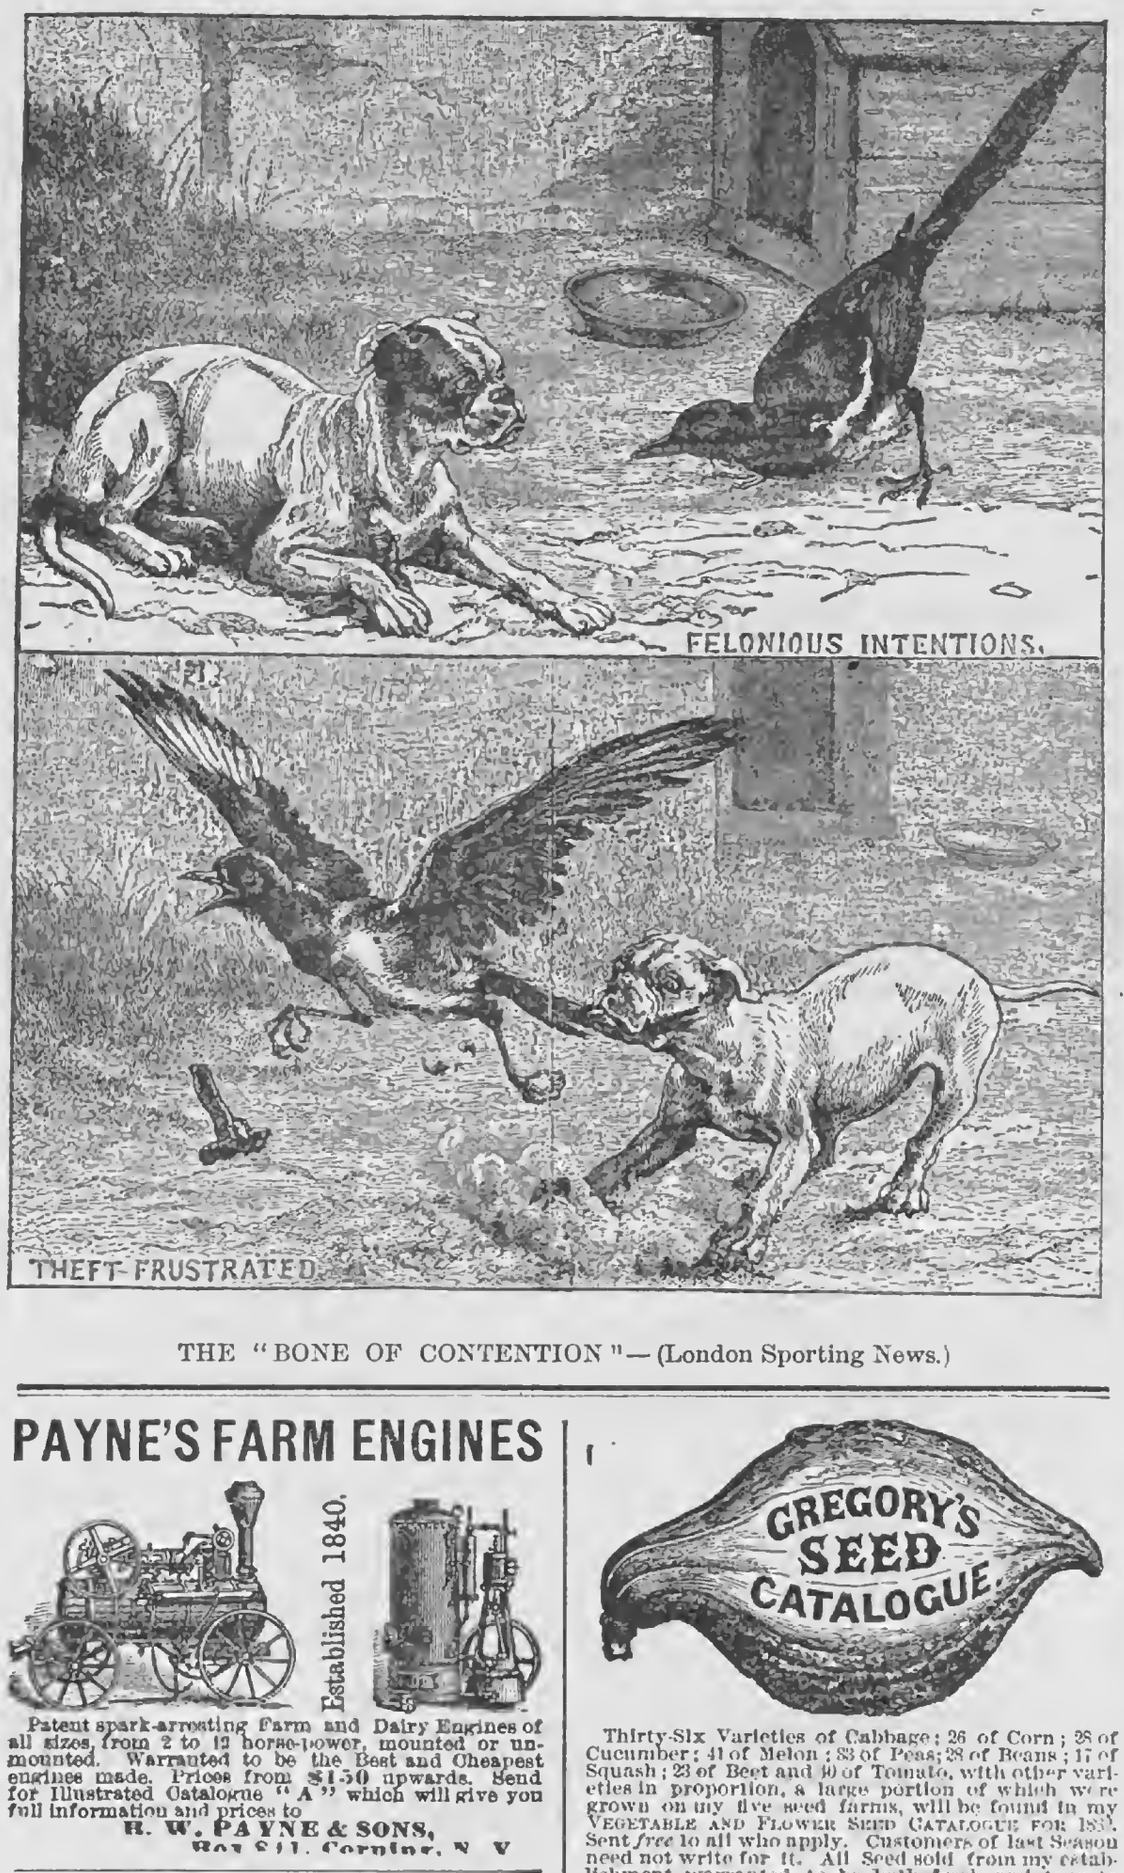
"FELLOW citizens," said the street-corner orator, standing on a dry-goods box amid the glare and smoke of many torches, "my position upon this question is a peculiar one." And just then, when the box caved in and let him down in the shape of a letter V, gripped by the neck and heels, the crowd rather thought it was.

"THEN you think you can leave your beautiful home and share a humble cot in the far West with the man you love?" "Yes, I would leave them all without a pang. Oh, Harold, you have made me so happy." "All right, then: I have a friend who is going to do that sort of thing, and I will mention it to him."

A NEW JERSEY widow couldn't earn six dollars a week at the washtub. She became a clairvoyant, and her income increased to sixty. It just shows that a man begrudges the quarter he pays for washing his shirt, while he will cheerfully give a dollar to stick his nose into the other world before the show begins.

"A YOUNG man from the country" writes to a city editor asking if authorship pays better than the theatrical profession. The editor has not given an answer, and if he wants to do the rural person a kindness we advise that he urges him to embark in the business of discovering comets. They are worth from $200 to $500 apiece, wholesale.—Norristown Herald.

BRIGGS hired a lively horse the other day to take a little exercise. He got more exercise than he wanted; and as he limped to the side of the road to rest himself, a kind friend asked him: "What did you come down so quick for?" "What did I come down so quick for? Did you see anything up in the air for me to hold on to?" he asked, grimly.



THE "BONE OF CONTENTION"—(London Sporting News.)

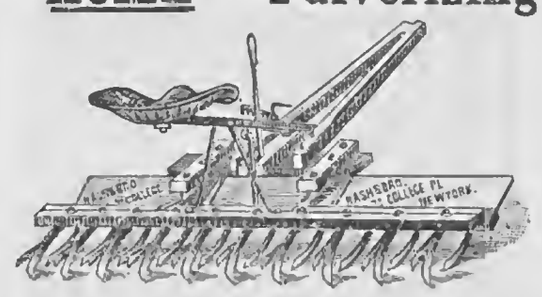
PAYNE'S FARM ENGINES

Established 1840.

Patent spark-arresting Farm and Dairy Engines of all sizes, from 2 to 12 horse-power, mounted or unmounted. Warranted to be the Best and Cheapest engines made. Prices from $150 upwards. Send for Illustrated Catalogue "A" which will give you full information and prices to

R. W. PAYNE & SONS,
Box 511, Corning, N. Y.

"ACME" Pulverizing



HARROW, CLOD CRUSHER AND LEVELER.

The "ACME" subjects the soil to the action of a Crusher and Leveler, and at the same time to the Cutting, Lifting, Turning process of double rows of Steel Coulters, the peculiar shape and arrangement of which give immense cutting power. The entire absence of Spikes or Spring Teeth avoids pulling up and scattering of rubbish. It is especially adapted to inverted sod, hard clay and "slough land" where other Harrows utterly fail, and also works perfectly on light soil.

Sent on trial to responsible farmers anywhere in the United States. Agents wanted. Send for circular.

NASH & BROTHER, Sole Manufacturers,
HARRISBURG, Penn., and 22 COLLEGE PLACE, New York City.

$5 to $20 per day at home. Samples worth $5 free. Address Stinson & Co., Portland, Me.

50 Cards. Feather & Hand Series &c., fancy case 10c. Samples 3c. Empire Card Co., Birmingham, Ct.

Thirty-Six Varieties of Cabbage; 26 of Corn; 38 of Cucumber; 41 of Melon; 83 of Peas; 28 of Beans; 17 of Squash; 23 of Beet and 40 of Tomato, with other varieties in proportion, a large portion of which were grown on my five seed farms, will be found in my VEGETABLE AND FLOWER SEED CATALOGUE FOR 1880. Sent *free* to all who apply. Customers of last Season need not write for it. All Seed sold from my establishment warranted to be both fresh and true to name, so far, that should it prove otherwise, I will refill the order gratis. The ORIGINAL INTRODUCER OF EARLY OHIO AND BURBANK POTATOES, MARBLEHEAD EARLY CORN, the HUBBARD SQUASH, MARBLEHEAD CABBAGE, PHINNEY'S MELON, and a score of other new Vegetables, I invite the patronage of the public. New Vegetables a Specialty.

JAMES J. H. GREGORY, Marblehead, Mass.

CHEAP FARMS
AND NEAR TO MARKET.

The State of Michigan has a good climate, a fertile soil, four thousand miles of railway, and sixteen hundred miles of lake transportion, convenient markets, a settled society, established institutions, great and diversified industries, a liberal free school system, low taxes and practically no debt. It has also several millions of acres of unoccupied lands, suitable for almost every variety of husbandry, many of them subject to free settlement under United States or State Homestead laws, and all of them for sale at prices within the reach of men of small means.

A PAMPHLET, *issued under authority of the State*, containing a map of Michigan, sketches of its Industries, Agricultural Productions, and Institutions, and descriptions of its Soil, Climate, Timber, the situation of its Unoccupied Lands, etc., will be sent *free of charge* on application by letter addressed to the COMMISSIONER OF IMMIGRATION, DETROIT, MICHIGAN.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME.

VOL. XL. No. 1666.} NEW YORK, DEC. 31, 1881. {PRICE FIVE CENTS $2.00 PER YEAR

[Entered according to Act of Congress, in the year 1881, by the Rural New-Yorker, in the office of the Librarian of Congress at Washington.]

Farm Topics.

ENSILAGE.

J. B. LAWES, LL. D., F. R. S.

It is stated by a writer on the subject of ensilage that grass contains a greater amount of nutrition when in blossom than at any time before or afterwards; and that what is true of grass is also true of grain.

While I am quite prepared to accept the fact as regards grass, I do not think it follows as a *necessary* consequence that the same is true as regards the ordinary grain crops, and at all events the subject is worthy of a few minutes' consideration.

The main function in the life of a plant is to provide seed for its reproduction. The seeds of most of the grasses are exceedingly light, and form but a very small portion of the weight of the whole plant; at the time of blooming therefore all the sugar and starch required to perfect the seed is already stored up in the stem and leaves, and the crop, if allowed to ripen its seed, will produce woody matter instead of more starch and sugar.

In the cereal grains the seed bears a considerable proportion to the whole crop. In some the seed and straw are of the same weight; in others, as, for example, in wheat, the proportion may be 60 or 70 pounds of grain to 100 pounds of straw, and in all cases the seed forms an important item in the whole weight of the plant.

I think there is evidence also to show that a considerable portion of the starch found in the seed, is not to be found in the leaves and stem at the time when the plant is in full bloom.

At Rothamsted in 1847, we selected a very level acre of wheat, which was divided into five portions, and cut at five separate periods, commencing with the 21st of June when the plant was in bloom, and ending when the wheat was ripe. During this period the dry weight of the crop had doubled itself.

Professor Anderson also carried on some experiments; he did not, however, destroy a whole crop of wheat for the purpose, as we had done at Rothamsted, but operated upon a certain number of carefully selected specimens. Between the time of blooming and maturity he estimated the increase of dry matter per acre at 2,000 pounds.

A very large addition is therefore made to the solid matter of the crop in the interim between the two periods; the sugar in the stem is converted into starch, more woody matter is formed in the stem, and it would appear quite certain that a considerable proportion of the starch, which is deposited in the seed, did not exist in the stem, in any form at the time of blooming. We have no means of knowing how much was stored up in the roots and how much was derived from the atmosphere; it would therefore be a mistake to say that at the time of blooming a corn crop contains as much nutritious matter as when it is ripe.

In the former stage the nutritious matter is more soluble, and more equally diffused throughout the whole of the plant, but the total amount is less than when the corn is ripe. In Mr. Bailey's book on Ensilage he gives the chemical composition of the corn plant in the milk, and of the same corn as ensilage. Calculated upon the dry matter, the corn in the former state contained five-and-a-half per cent of mineral matter, while the dry matter of the silo corn contained more than nine per cent: this, if correct, would indicate that about 40 per cent of the dry organic matter of the corn had been lost by fermentation.

At Rothamsted I have about 54 cows in milk, and about 30 head of young stock. Their main supply of food until next May will consist of mangels. More than half of the whole dry matter of these mangels consists of sugar, and this sugar is the most valuable of all the ingredients which they contain. Now if I were to subject these mangels to fermentation in a pit until the sugar was converted into alcohol and carbonic acid, I should be destroying that valuable element of food, which I had been at so much cost to obtain!

In the clamps where our mangels are stored, their quality improves rather than the contrary, and a farmer would give a preference to roots which had been stored up for six months. If succulent food for Winter is so valuable in the States, some comparison should be instituted between the relative advantages of corn and mangels.

As regards ensilage I must confess that I do not altogether like a process which appears to be so destructive of food.

Rothamsted, England, Dec. 6., 1881.

EARLY HISTORY OF AGRICULTURE.

LESTER A. ROBERTS.

The ages following the fall of the Roman Empire saw little progress in agricultural matters, which were kept alive mainly by the religious institutions, which were also the repositories of most of the knowledge of the arts and sciences that were preserved for us. The first revival appears to have been in Italy. But idleness seemed to prevail until the time of Pope Sixtus, who, in 1584, acting on the principle that "a people not pressed by taxes are apt to grow indolent, and that industry is the only source of riches and plenty to a State," forced his subjects to labor, to their advantage and his gain, raising them from sloth and poverty to industry and comparative wealth. In Tuscany and Lombardy the culture of the vine and olive was improved, their products were demanded for export, and the profits therefrom enabled the people to improve their estates. The richness of the pastures, especially in Lombardy, and the fact that the temperature was such that cattle could thrive in them through the Winter and water was plentiful for irrigation aided materially in stock culture. This in turn furnished manure for other crops, and for a time this section showed greater improvement in agriculture than any other country in Europe.

While Spain was a portion of the Roman Empire it was second to no province in agricultural advancement. During the fifth century it was overrun by hordes from Northern Europe, and finally came under the dominion of the Goths, in whose possession it remained until conquered by the Moors in the eighth century. The Goths were too much engaged in the chase and in wars to pay much attention to agriculture, but with the advent of the Moors it revived and continued to improve until their expulsion near the end of the fifteenth century, when it again declined. The Moors brought with them from Africa various new plants, as well as their methods of culture, which were before unknown in Spain, and during their dominancy agricultural interests materially improved. Particular attention was given to the culture of fruits, of which they introduced most of the best kinds now grown there. Irrigation was practiced to a considerable extent and much attention was paid to saving and applying manures. The Moors were an industrious people, and although they paid much attention to manufactures, agriculture was considered by them the most honorable occupation, and under their continued administration Spain would doubtless have been the leading agricultural State in Europe. But the "Christian" and the "Infidel" could not live together in harmony, and the Moors were expelled, taking with them the industry and leaving the pride and indolence of the country. During the next century America was discovered under Spanish patronage, and attention was directed to the New World that was supposed to abound in gold and silver and precious stones. Albyterro, a Spanish author of the seventeenth century, wrote truly, "the people who sailed for America in order to return laden with wealth would have done their country much better service to have stayed at home and guided the plow." With the nineteenth century a general improvement seems to have sprung up, but wars and internal discords checked it, and bad government and priestcraft combined have done much to keep Spain from being what, under other circumstances, it might have been, the garden of Europe.

All that is known of agriculture in France, previous to the ninth century, is gathered from the laws, which appear to have been favorable thereto. Charlemagne in the ninth century encouraged the culture of vines and orchards. Horses seem to have been more common than in Italy, which, with cattle and sheep, were pastured in commons and forests. After this time civil wars were prevalent and agriculture declined, but revived again before the close of the twelfth century. The best lands were under the control of the Church, and were made to pay considerable revenues. In the thirteenth century we find wind-mills for grinding corn introduced. From this time little progress was made until about the middle of the sixteenth century, when considerable enterprise was displayed, and the first agricultural work produced in France, a short tract by Bernard de Pallisy, was published. Later we find Duhamel's New Husbandry. The Government seems to have favored general cultivation of the soil, and France is said to have abounded with "corn, grain, pulse, wine, cider, flax, hemp, salt, wool, oil, dyeing drugs, cattle, great and small, and everything else, whether necessary or convenient for life, both for home consumption and exportation."

The nations of Europe north of the Rhine and the Danube were, previous to the seventeenth century, so much engaged in civil wars and invasions into neighboring countries that but little attention was paid to agriculture. In about the middle of the sixteenth century the Elector of Saxony planted the first vineyard that was known within the country over which he ruled, and seems to have been considerably interested in the cultivation of the soil for other purposes.

When Britain was invaded by the Romans they carried with them such agricultural knowledge as had become common in the Empire, and considerable progress was made during the 400 years of their occupancy; but they left and were followed by the Anglo-Saxons, cultivation ceased and the people subsisted on game caught in the chase, and the flocks and herds that found abundant pasturage, and especially on the swine, for which the seeds of the oak and beech furnished large quantities of food.

The Welsh at this period mainly depended on their cattle and sheep for subsistance, but we find some curious laws relative to cultivation. Plowing with any other animals than oxen was prohibited. None were allowed to guide a plow who could not make one, and the driver should make the twisted willow ropes by which it was drawn. Certain privileges were allowed to him who should manure land, clear a field from wood, or fold his cattle on another's land for a year. In Ireland and Scotland progress in cultivation was, if possible, far less than in Britain and Wales.

The Saxons found, however, that the raising of field crops contributed to their comfort, and although working the ground was thought a menial employment, only fit for slaves, it became after a while an apparent necessity, and the princes and other large landholders divided their estates into inlands and outlands, the former near their houses, which were worked under their own directions, the latter more remote and let out for rent, which was very small, established by law, and usually paid in kind.

When the Saxon rule in Britain was overthrown by the Normans a marked improvement in agriculture commenced. The thousands who came from Normandy, France and Flanders brought with them the knowledge those countries possessed, and it was not long before the best men in the land were interested in the cultivation of such crops as were then known. Laws were made in the interests of the farmers, implements of husbandry were improved, manuring practiced, fruit trees and vines became common, and the whole country bore a different aspect from what it had ever borne before. This progress continued during the thirteenth and fourteenth centuries, but was stayed about the middle of the fifteenth century by the civil wars that then raged. The peace that followed the accession of Henry VII., in 1485, again gave opportunity for the improvement of landed possessions, but the great demand for wool from the Netherlands induced the proprietors to turn their attention to sheep raising, and to such an extent was this carried that laws restricting the number of each flock to 2,000, were made. Certain causes thereunto working, however, after a while compelled the changing of the pastures into cultivated fields, and the herdsmen resumed the plow.

The first English treatise on husbandry appeared in 1534. It was written by Sir A. Fitzherbert, a lawyer and judge. This was followed by Thomas Tusser's Five Hundred Points of Husbandry, and still later we find Jethro Tull's Horse-Hoeing Husbandry, an argument in favor of higher cultivation, showing the effect of more thoroughly intermingling particles of soil.

About this time much attention was given to the breeding of horses, and singular laws were enacted. One enjoined on all prelates, nobles and others whose wives wore velvet bonnets to have stallions of a certain size for their saddles. The legal standard was 15 hands for horses and 13 for mares. "Unlikely tits" were executed.

From the beginning of the sixteenth century agriculture partook of the general improvement that was being made by the invention of the printing press, the revival of literature and the more settled authority of Government, and during the reign of Elizabeth it had attained a considerable degree of respectability.

Many circumstances combined to retard agricultural progress in Scotland. The general surface of the soil and the climate are not conducive to culture, and the civil dissensions that prevailed took men from the plow to engage them in the almost continual strifes. Many laws were made looking to the protection and encouragement of husbandry, but they were of little avail.

The seventeenth century is marked by some important improvements in English husbandry. At this time works on agriculture had become more common and seem to have exerted favorable influence. Clover and turnips which had been long and profitably cultivated in Flanders, were introduced, and potatoes, that had been known there since 1565, but only to be neglected, began to receive the attention they deserved.

While in most parts of Europe agricultural interests and knowledge advanced almost constantly from the earliest period of which we have definite knowledge, they seem to have made little progress in the East. There is no perceptible advance in the processes of China and Japan, which may be said to be curious rather than successfully practical. Central Asia was little known and Western Asia, including Persia, Palestine, the African shores of the Mediterranean

and all the countries under the Turkish dominion, seem to have retrograded rather than advanced. In such portions of Southern Asia as India, where European influences have been felt, the culture of the land has received much attention. But in European countries the beginning of the seventeenth century seems to have commenced a new era in agricultural history, and before its close much improvement could be seen in every section not only in the variety of crops raised but in the means employed to improve them and to obtain a larger production from the same area of land. Little by little scientific knowledge increased and was, cautiously at first, but as familiarity grew by acquaintance, more generally applied to agricultural processes with advantage. It was found that something besides the mere putting of the seed into the ground and waiting for it to grow was necessary to insure the best result, and experiments, few and rude as they were at first, soon showed the intelligent that to obtain the best result he must combine thought with labor. The number who were at first able to comprehend this situation were few, for even then the majority were not easily convinced that the old ways were not the best. It may be said that the study of agriculture as a science commenced with the seventeenth century, although the students were few. But an atom of truth once set free must at some time accomplish its work. Looking back from our present standpoint and observing the processes and the implements used by the farmers of the olden time, we are more inclined to be astonished at the results obtained than to wonder why they were not greater.

As population increased the needs of the people increased in proportion, and civilization and education contributed both to increase those needs and add thereto many wants unknown to savagery. Needs and wants felt act as incentives to their fulfillment, and we can plainly trace growth and improvement in agricultural affairs to these causes. Besides, when a country becomes densely populated it becomes necessary, in order to raise food for its support, either to put more land under cultivation or to increase the productiveness of that already cultivated, or both.

It would be interesting and instructive to follow the progress of husbandry in different nations from the time of which we have spoken to the present, and to watch the development of many of the different productions of both the animal and the vegetable kingdoms from their natural conditions to those in which by culture, they are now found. But this would require volumes instead of the brief space afforded in these columns.

Horticultural.

RURALISMS.

THE pleasant holidays have come again, to many, especially the young, the happiest of all the year. There are few at this time whose minds are not more or less perplexed with what to select as a suitable present for father, mother, brother, sister, or friend. It has occurred to me that in not a few cases this perplexity might be happily overcome by making choice of the RURAL NEW-YORKER as a useful and appropriate holiday gift. For example, what could be a more suitable present from a denizen of the city to his country cousin or friend, to whom he is indebted for many days (and perhaps weeks) of healthful pleasure, with, it may be, only a "thank you" in return? Your country cousin or friend would be quite certain to obtain from the RURAL such valuable hints and suggestions as would add increased warmth to your reception next Summer. That would be a substantial pleasure cheaply purchased. It would also be doing good, which is a point worthy of consideration. It is the nature of many presents that they must be so placed that we see them only occasionally, and they are therefore only occasional reminders. If you send the RURAL as a present, it will serve as a pleasant weekly reminder of your thoughtfulness and good will, and more than one will be sure to exclaim, "Tom is a splendid fellow for sending me the RURAL," or a feminine voice may be heard saying in subdued tones, "How good Aunt May was to send father the RURAL," and you are made happy in the consciousness of having given a useful pleasure. There is really a double pleasure in this case, and you may prolong it by prolonging the term of subscription to the RURAL. So may it be. [We are greatly obliged to Horticola for his very sensible suggestion. Eds.]

HORTICOLA does not forget his RURAL friends in the midst of his cares, and he sends to one and all a "Merry Christmas" and a "Happy New Year."

I HAVE noticed during the past month, in different parts of the country, a faulty and wasteful application of manure to the apple orchard. In a ride of nearly a hundred miles I saw only one instance of its application with any apparent knowledge of the growth of the tree. The manure, in all these cases, except one, was heaped around the trunk of the tree and extending perhaps two or three feet from it. These orchards I should judge to be from 15 to 40 years old. This manner of applying manure to orchards I believe to be quite common, and it ought to be known that it is wasteful and does but little good; it not only does little good, but is sometime productive of evil. The feeding roots have by this time wandered many feet away from the trunk of the tree. If the manure were mostly spread around and a few feet within the circumference of the branches, thousands of hungry little mouths would be found there ready to take it up and convert it into delicious fruit and a healthy growth of leaves. The really proper way to manure an orchard in grass is to spread manure over the whole of it, using it most liberally under the spread of the trees. Treated faithfully in this way at proper intervals, we should be spared the doleful sight of so many orchards "running out" before their time. A large percentage of orchards die from starvation and neglect, and not from old age. How many farmers, in any part of the country, give half as much labor and attention to their orchards as they do to a crop of corn, for example? There are, I am happy to say, some notable exceptions to this, and they have their reward in long-lived and productive orchards, and very handsome fruit.

THE new Tradescantia referred to by Leon is a very beautiful plant. It is, however, less robust than T. zebrina or Buchanani. With me it has shown a tendency to revert to the green type, from which it is a sport, which does not yet seem to be well established. The green growth should be cut off as it appears, and the plant propagated only from selected shoots. I forget whether it has yet been offered for sale, but it deserves a place in any collection.

THE double-flowered, variegated sweet alyssum, to judge from one year's experience, is an improvement on the single-flowered variegated variety, being more strongly marked and a more robust grower. There are two or three more new sweet alyssums. Tom Thumb is a very dwarf, compact grower, and blooms profusely. Colossus, on the contrary, is a strong, rampant grower, with larger flowers than the species. I have not yet made up my mind how much I shall like it, but I propose to use it as a pedestal two or three feet high, on the top of which to place Tom Thumb. I think it may at least be prettily utilized in that way. HORTICOLA.

RAYS.

ORDINARY roses, as Isabella Sprunt, Safrano, Bon Silene, and Perle des Jardins are selling in Boston for $3 to $4 per hundred buds, whereas Bennett's hybrid tea, Beauty of Stapleford, is fetching a dollar a dozen, and his Duke of Connaught a dollar and a-half a dozen. Some of the florists around Boston, declare that Duke of Connaught will be the most profitable rose they can grow, its fine, long buds and brilliant, velvety, crimson color render it a great favorite with customers, and so far it is profuse, but only moderately free in growth. Beauty of Stapleford fades to lilac a little too quickly, but this is only visible in daylight; in gaslight it looks beautiful. It is very free and profuse. Duchess of Westminster, bright cerise, because of its fragrance and finely formed buds, is a favorite with customers, but the growers think it wants too much heat for them to grow it profitably. Jean Sisley is too double; the buds don't open perfectly.

* *

I TELL you what it is, Mr. Editor, it does me good to see men stand up, and, heedless of opposition, speak out their honest convictions. You say you never liked the silver maple as an ornamental tree. Neither have I, but I have caught it smartly more than once for saying so. In a pamphlet, "Ornamental Trees for Massachusetts Plantations," by John Robinson, of the Arnold Arboretum, which was kindly sent to me by the author, I find: "We have a long line of golden oaks, golden ashes, golden lindens, striped-leaved, silver-leaved, or golden-leaved varieties, hideous to any lover of nature. Looking upon these sickly plants, each seems, by turn, more ugly than its neighbor. All should be sent to the rubbish-heap together, and permanent natural productions planted in their places."

DEUTZIA-PARVIFLORA is a new shrub from Northwestern Asia, and, my word for it, it is a pretty one. It has an upright growth like a Deutzia crenata, but it is not quite so rank, and it comes into blossom at the same time as Deutzia gracilis, which is about two weeks earlier than crenata. Its flowers are white, in dense clusters like those of a spiræa, and, in fact, when in bloom, the whole plant has more the appearance of a spiræa than of a deutzia. It is perfectly hardy: indeed, with me, it is hardier than crenata. Very few nurserymen have got it for sale, but I find it advertised in Parsons' catalogue at 35 cents a plant.

* *

BERMUDA GRASS is not hardy in the Northern States, and I am glad it isn't, else once at home I never could remove it. But as a hanging-basket plant for the window, it is "just lovely." Start it in August or September in a pot or basket in turfy loam and manure, half-and-half, and never let it lack for water, and it will grow so rankly that it will not only hide your basket beyond view, but hang down past it for a foot or two.

* *

I CERTAINLY admire the progressive spirit that characterizes the work of the RURAL. Its principal aim seems to be the benefit and instruction of the people, and not only does it seek and publish the unreserved opinions of its near and distant readers, but especially wishes to know the dark side as well as the bright side of the subjects of which it treats; and I am sure we can all bear testimony that its editorial reports are exceptionally beneficial, they are so impartial.

* *

MOST of you must be familiar with the little partridge berry plant that grows so abundantly in our woods. It is a pretty little evergreen vine that forms tufts or mats about tree roots or in broad patches upon the ground under trees, and is studded over with scarlet berries that remain on the vines over Winter. Now this little plant is a first-rate window plant, and will grow well, like moss, on the surface of the soil in pots containing callas, fuchsias, or other plants; it delights to associate with ferns, and in a fern case thrives amazingly well.

* *

LAST Summer they had masses of large plants of Chinese Hibiscuses planted in the garden of the Soldiers' Home at Dayton, Ohio, and they were about the showiest thing in the garden. Their large cerise and scarlet flowers were very conspicuous. Now any one can grow these plants. Plant them out in a sheltered but sunny place in the garden in May, and lift and pot them in the Fall, when, if they have grown beyond the bounds you can accommodate, you may cut them in as much as you please. You may winter them in the house, in a light, airy, frost-proof cellar or pit, but at no time should they be allowed to get as dry as you would have a dormant fuchsia or lemon-scented verbena; they must be kept moist. There are many shades of red among them, but the glowing, velvety scarlet is the prettiest, and there are yellowish ones, too. They may be propagated by seeds and cuttings.

* *

SPEAKING of Arbor-vitæ hedges being rendered bare on one side, page 810, reminds me of a hedge at Waukegan, Illinois. The branches all along the bottom on one side had died out or were sickly and had been cut out, and a row of young Arbor-vitæs was planted right up close to the old hedge to hide the nakedness. They took kindly to their new quarters and were pruned to suit the occasion, and when I saw the hedge a little while ago I did not perceive that it had been patched till Mr. Douglas called my attention to the fact.

* *

THE Arbor-vitæ as an ornamental hedge plant cannot, in my opinion, compare with the Hemlock Spruce. True, the Arbor-vitæ succeeds in many places where the Hemlock fails. The shears denude the hemlock of its beauty, but the knife will save its graceful form. The chamæcyparises (retinosporas) make, I think, the prettiest little hedges. They are used at Wellesley as such and to form borders about a foot in hight, just as a European would dwarf box. The tree box makes a fair little hedge with me, but gets disfigured by red spiders in the Summer time. It is hardier than the dwarf one. The Norway Spruce is the evergreen hedge plant mostly used about Boston, but it is not as pretty or as good in this way as our native White Spruce, nor does it live as long. The White Pine, begun with early, makes a soft and warm-like hedge, and it endures pruning better than any of the pines I have known to be tried.

* *

HEAVY snows in Winter sometimes break open Arbor-vitæ hedges, retinosporas, and other evergreen bushes. Now you can easily avert that. With a piece of stout cord tie the limbs in such a way that although the snow may bend the little twigs, it cannot open apart the bushes. And tie up the retinosporas lightly, loosely, but firmly into conical form; this not only preserves them from being broken by the snow, but saves them somewhat from the inclemency of the weather.

* *

WITH me the variegated althæa retains the whiteness in its leaves the season through, grows but slowly, and forms lots of flower buds, but never fully opens any of them.

* *

IF you have some choice evergreen trees, large or small, do not touch them, nor cause nor allow them to be touched in hard, frosty weather, else in Spring you may find that the parts that were handled will present a seared appearance, as if injured by the severity of the weather, whereas it was the handling that did the mischief.

* *

IF your ground is poor, lay a good mulching of rotted manure around your evergreens, as pines and spruces, and let it lie there till Spring, when you may fork it over into the soil very lightly; or, if not unsightly, let it remain on the surface during Summer. At any rate, do not dig it in. The best feeding roots are near the surface of the ground, and if you dig them up you destroy them and materially hurt your trees. Pines and the like like something good to eat, and in vigorous condition well repay such care. LEON.

PRAIRIE CLIMATE.

PROFESSOR J. L. BUDD.

THE notes I have furnished the RURAL on the relative adaptation of trees and plants to our prairie climate have elicited an unexpected number of queries from parties east of the lakes, who are looking westward for future homes. These letters mainly ask about the special climatic peculiarities to which we so often refer in connection with tree and plant growth. It is too large a subject to deal with in a letter or readable newspaper article, yet I will try to give some of the distinctive features of the climate we have to deal with in Iowa north of the 42d parallel, and some of the reasons for the popular Eastern belief that this can never become a reliable fruit-growing section.

The first thing that strikes the newcomer as peculiar is the absence from our groves and the timber along our rivers and streams of the conifers, kalmias, rhododendrons, fox grapes, narrow-leaved crab, beech, and many other trees and plants of the coast and lake regions. He also will note the significant absence of the mosses he has noticed in Eastern States pendent from trees, and even attached to fences, shingles and the sides of houses. In connection with these sign-manuals of prevailing aridity of air, he will notice a luxuriant development of Indian corn and all half-tropical plants of an annual character, indicating a higher Summer temperature than is known east of the lakes.

A brief residence here will give the further lesson that we are subject to sudden extremes of temperature and of atmospheric moisture. In Summer, after days and even weeks of westerly winds of desert-like aridity, which drink up with hungry avidity moisture from earth and plant surfaces, we may have a period of southerly winds loaded to saturation with moisture from the Gulf of Mexico. In Summer such changes are only injurious to thin-leaved trees and plants native to permanently moist climates. In Winter, however, the extreme changes in temperature and moisture, dependent upon a change of wind, are a very serious matter. In the midst of Winter a south wind may bring us days of Spring-like softness. Without warning, unless it come from the Signal Service dispatches, we may have the premonitory howls of a northwestern "down-pour," with a dry, biting air 25 to 30 degrees below zero.

A longer residence will disclose the fact that our seasons are extremely variable as to rainfall and variations of temperature and humidity. A period of three or four years may be so equable and mild as to permit the healthy growth of what we term the tender list of fruits. Then follows what we call a "test year," meaning an excessively hot Summer with little rainfall, followed by an intensely cold, dry Winter. The havoc and destruction of the extreme years are the grand checks to the wild planting of our thousands of settlers who come here biased in favor of fruits they knew most favorably in their old haunts in the Eastern or Southern States. With this very hasty glance at the main distinctive peculiarities of prairie climate, a few notes on the slow advances we have been able to make in adapting fruits, trees, and shrubs to the prairie requirements will be better understood.

When the prairies in the interior sections were not dotted with a tree or a cabin, ob-

serving scientists, such as Henry, Maury, Knapp, Russell, and Dr. Kennicott, reiterated the opinion that all successful tree planting upon the Northern prairies must be of a character to endure such extreme seasons as that of 1842-3, when the intensely hot, dry Summer was succeeded by a Winter freezing the Mississippi solid in November above the Des Moines rapids, and when every day in March exhibited the thermometer from one to 30 degrees below zero.

But not one in a thousand of our settlers read, or, if they read, believed such predictions, and tree planting went on until 1855 with relatively few drawbacks, when the great drought of 1854 and the terrible Winter of 1855-6 left scarcely a trace of the widespread folly of the people in planting the Baldwins, the Greenings, the foreign pears, plums, cherries, and oven peaches. A few hopeful enthusiasts now began to talk of the few varieties unscathed by the "test Winters," and of the introduction of varieties from the home of the Oldenburg. In 1868 we began to hear again the talk of ameliorated climate. By this time the great herds and the golden harvests had brought plenty to thousands of prairie homes, and a grand harvest for the Eastern tree peddlers began. Again, in 1872-3, the "test Winter" wrought ruin to the petted young orchards.

This hasty sketch gives an idea of our drawbacks in horticultural operations, and of our failure with most of the obtainable fruits popular in the Eastern and Southern States. Purposely the discouragements and hindrances have alone been noted. The good things sifted out by our broad-gauge system of experimentation will be noted at another time, not forgetting to boast of the many compensating advantages which Nature has given to dwellers in the great prairie garden.

Ag'l Coll., Ames, Iowa.

LINDLEY'S THEORY OF HORTICULTURE.

PROFESSOR J. L. BUDD.

I AM glad to hear that a publisher of New York have just brought out an edition of this very valuable work in neat form at the low price of $1.50. It should be in the hands of every intelligent plant and tree grower in the United States, not already supplied with the old English edition. What A. J. Downing said of it will apply to-day: "It is the only treatise of the kind extant, at least in the English language. It is at once remarkably simple and highly philosophical; free from superfluous technicalities, and at the same time truly scientific.

Without entering into tedious subordinate details, it offers a lucid explanation of the general nature of vegetable actions, and of the important principles which lie at the foundation of all the operations of horticulture, and which the intelligent gardener or amateur can readily apply for himself to each particular case."

The work has many valuable notes by A. J. Downing. It was written by Dr. Lindley when Secretary of the Royal Horticultural Society of England, when the gardens of this Society were annually enriched with contributions from all portions of the world. It was revised by him when editor of the Gardeners' Chronicle, in which weekly appeared every advance in modes and methods, and every advance in vegetable biology. Since that time a few changes and modifications have been made, slightly affecting some of the statements as now published. But these changes in general principles are so slight, and the explanations to be made so few, that they offer no barrier to the use of the work in advanced horticultural classes in the agricultural colleges.

Agricultural College, Ames, Iowa.

ON Nov. 21, I took in the smaller tea roses; the variegated Japan Euonymus; the always admired Poinciana (which deserves a place wherever there is cellar room for a few half-hardy shrubs), the roots of the white pond lily, and some rows of fine celery. A large sunken pot holding nearly a bushel, which had had its drainage plugged and puttied up, and been hooped with tarred iron to serve as a pond for the lily, seemed to be an excellent thing to store a lot of the celery in on the new plan, viz, to stand in a few inches of water. So, having a pit or ditch about three feet deep in the lower part of the garden, which is always wet during Winter, I put the lily roots down in the bottom of that; marked the place by a tall stake, white-painted and lead-penciled on the top, and I found that I could store in the pot a surprisingly great quantity of the celery, the roots being comparatively much less bunchy now than when the plants are young. Having three sorts of celery, all duly labeled, for we are all given to the amusement of experimentation at our house, I loaded up two four-gallon stone-ware crocks for two dwarfed sorts, and found them just the thing. I left the roots in these, with a little damp soil attached, without water for about three days, the leaves scarcely flagging any in the rather damp cellar, which is pretty well lighted. This was done in accordance with an old secret among gardeners—that of leaving roots or cuttings in merely damp and still air for awhile to heal over before they are soaked by watering. The air in the interstices of soil or moss is still and damp, and so very favorable for this healing or callu-ing. How proud the old gardeners used to be of their trade secrets! and how careful not to tell them! But the modern newspaper thrusts its lantern into every corner, and in its penetrating light nothing is hidden that does not become revealed. All the secrets of garden culture that are worth knowing are opened secrets now. W. G. W.

Pomological

CAUSES OF COLOR AND FLAVOR IN FRUITS.

T. T. LYON.

Color.

THE popular belief seems generally, if not always, to have been that the warm climate and long seasons of the South are the cause both of high color and superior flavor in fruits. I well recollect the comments made more than 20 years since at a meeting of the American Pomological Society, held at Philadelphia, upon some fine specimens of apples coming from North Carolina, whose rich, high color was characterized as unapproachable under a Northern sun. I also, not unfrequently, find the dream of the enthusiast, and the imagery of the poet employed to depict the wonderful effect of fervid Southern suns in this respect.

More recently, with the rise of pomological interest and the wonderful dissemination of knowledge on the subject, consequent upon more modern facilities for its interchange and transmission, we find abundant occasion to doubt the strict correctness of this still popular notion. It is within the recollections of most adult persons that, after the gold excitement of California when, among other pursuits, the attention of many was turned to fruit culture, we came to learn that, while their milder climate developed fruits to an enormous size, there was not a corresponding development of color; but, on the contrary, a very decided deficiency in this particular. This is not true of California fruits alone; but is also measurably true of nearly or quite all other fruit-growing localities, as we come eastward and northward, the color hightening nearly as the latitude increases, till we reach very nearly the northern limit of fruit culture, and especially of the cultivation of the larger fruits in the region of Northern Michigan and Ontario, where, also, we are surprised to find the maximum of color. I confess that this result was a surprise to me; but to establish its correctness I need only refer to any observing connoisseur of fruits who at the Centennial Exhibition had occasion to compare the fruits of our whole country as there brought together. Nothing connected with the pomological exhibit at that time was more noticeable than the fact that none of the exhibits there shown equaled in brilliant, rich colors the fruits of the British Provinces and of Northern Michigan, Wisconsin and even Minnesota.

It might, to be sure, have been alleged with some show of propriety, that there was a noticeable diminution of such coloring as we proceeded westward. Such was, in fact, clearly true of the chief exhibits of Michigan, Illinois, Iowa, Nebraska, Kansas and California; but as we are at the same time tending southward, we clearly have an equal warrant for charging the result to that cause.

An exception to such rule may be claimed in the case of the Fallawater, which in its native region puts on a fine red cheek, while farther north it is often wholly destitute of red. The exception, however, is only seeming, since even this fruit when gathered wholly without color, may usually be given a brilliant red cheek by exposing it for some time to the direct light of the sun after gathering, showing that it merely requires a longer season.

The potency of the long-continued sunlight of the far north for the development of color was also very noticeable in the collections of apples from Montreal and from the Grand Traverse region of Northern Michigan, at the recent meeting of the American Pomological Society, at Boston.

The facts above narrated seem to lead very naturally to the conclusion that abundant and long-continued light rather than great heat, is the dominant factor in the development of brilliant colors in fruits.

FLAVOR,

on the other hand, while it can by no means be held to be independent of the influence of light, seems, in an increased degree, to demand the elaborating influences of warmth.

The Summers of the North are often extremely warm; and experience has long since demonstrated that upon the transmission of a variety of fruit northward, there can be no doubt of its equal success in its new location, if only the season is of sufficient length to bring it to maturity before the development of flavor shall be checked by the chill of Autumn. The Fallawater apple in the climate of the States north of Pennsylvania loses not color only, but also flavor, and while exposure to light, as above stated, has the effect to develop its color, the same can by no means be said of its flavor. That must be matured in a good degree, at least, before removal from the tree, since if picked before the requisite stage is reached, it will remain hopelessly immature.

It is also true, however, that very few fruits, if we except those maturing quite early in the season, can be expected to retain their full quality when removed northward. The consequence of this is that very few of the long-keeping fruits of the Ohio Valley and Pennsylvania are found satisfactory in New York, Southern Michigan and Wisconsin; although it is an apparently inexplicable fact that trees of such origin invariably prove more hardy northward than those of indigenous origin there. There are, however, exceptions to this rule, among which I may name Grimes's Golden, Oconee Greening, Jefferis, Vandevere and some others, which seem to lose little if any flavor in coming northward.

The Apiarian.

POLLEN.

PROFESSOR A. J. COOK.

IN articles written for other journals, and in my "Manual of the Apiary," I have stated that the old bees could live for long periods without pollen. As honey, however, is a hydro carbon, and so contains no nitrogen, it is to be presumed that the old bees need and do eat some pollen during the active season, to supply the waste of tissue, consequent upon all physical activity.

I have further stated that pollen was an indispensable requisite to brood-rearing; that it is an essential element in the food of the larval bees. As a scholium under this last proposition, I have expressed the opinion that in some conditions the presence of pollen in the hive in Winter is a positive injury, and that in all cases it is unnecessary. But I would remark, and with emphasis, that this pollen is very valuable as soon as the bees commence to fly the following Spring, and then any frames that contain it should be given to the bees.

These facts have lately been called in question by several writers in the bee journals. I think most of the critics object simply because they do not understand my position. One writer, however, who, whatever else may be said of him, puts forth very original ideas, and contradicts nearly every well grounded fact in apiculture, calls for proofs.

1. I have wintered bees on food which was made wholly of cane sugar, and which I had analyzed, and which gave no trace of nitrogen. This was fed on clean combs which, so far as we could see, contained not a trace of bee-bread. New combs are so transparent that they cannot contain more than the faintest trace of pollen, at least without showing it. I have fed bees, right in the busy season of the year, this same kind of food and have had them so shut up that they could get at no other, and they have lived in this way for weeks and have built large combs, and when given their liberty were in good condition. It is impossible to prove that bees need and must have nitrogenous food when they are actively storing, but this position is sustained by all analogy.

2. In the last experiments the bees would have enough pollen in their stomachs and on their pollen baskets, so that they would put quite a little in the cells after first building the comb, and so would commence rearing brood, but the brood-rearing would soon be discontinued. After the brood-rearing had ceased, I could set it to going at once, by giving the bees a frame of bee-bread. In such cases we must not feed honey, as there is often quite a little pollen in the nectar which the bees have brought to the hive. Some honey, as bass-wood, often contains quite a trace of this. This would give enough pollen to rear a little brood. Again, for several Winters I have praticed giving half our bees pollen, and the other half, frames with no pollen. In all cases we have noticed that those without pollen would always be without brood in the Spring, while in the other hives we almost always found brood. Those without pollen would go to gathering very fast as they could get pollen the first of April and would then, or as soon as we would supply the lack of pollen in the hive, go rapidly to breeding.

These last experiments have satisfied me that bees are often better off with no pollen in Winter. In the best condition they will eat little or no pollen, as they breed very little, and in these circumstances the presence of pollen would do no harm. So in just the best cellar or in any condition where the bees are kept just right, no harm will result from the presence of pollen. In the South, too, where the bees fly out often, there is no danger from the presence of pollen in the hive. Here in the North, on the other hand, we often have a warm time in January, and the bees, unless so protected that they do not feel the warmth, will commence breeding if they have pollen. They may get a large area of brood. Now if there is no chance for them to fly, or if the weather becomes cold they are injured by this activity which came, we may say, as the result of the presence of pollen. The next Spring they are in feeble condition, and there is more of a tendency to dwindle away as the warm days incite them to fly forth.

If bees can be kept perfectly quiet in Winter, they eat nothing but honey, and do not need to void their fæces. With activity comes more food-taking, perhaps, too, they take some of the nitrogenous food, and as a result they become diseased and die. I have never found any support of the theory of the late Mr. Quinby, that bees excrete a dry powder in Winter. The facts that I observed in our colonies wintered with and without pollen have led me to the above theory. The theory may not be correct, but the facts are still to be explained. I am so much convinced that I remove all of the pollen if I can as I prepare the bees for Winter.

WASTED SWEETNESS.

THERE is sufficient power in the winds to do all of the labor that is performed upon the earth, but only a very small portion of this power is utilized; there is, also, probably, enough *honey* that goes to waste for want of bees to gather it, to sweeten all of the pies, cakes and cookies that are ever baked. Upon nearly every eighty-acre farm there is enough honey secreted by the flowers each year to furnish its owner with "sweetening power" from honey harvest to honey harvest. It is admitted by our best apiarists that a few colonies in a place give better results than a large number; therefore, if the bees were scattered about, a few colonies at each farm, there would not be so much of this sweetness wasted. To be sure, there are, and probably always will be, people who make a specialty of bee-keeping, owning their hundreds of colonies; and this is all right; it is to such persons as these that we are indebted for the improvements that have made bee culture the safe, pleasant and profitable pursuit it now is; but this need not deter any farmer from keeping a few colonies of bees that will supply his table with that most delicious and healthful of sweets, pure honey.

I presume that many do not keep bees who otherwise would if they did not fear the stings. Let all such procure a colony of pure Italian bees, in a good, movable-comb hive, a good "bee book" that will tell them how to manage them, a "smoker" and a bee-veil, and, if very timid, some rubber gloves. Thus equipped, they will have no trouble in learning scientific bee-culture without receiving even a sting; and, if they will commence in this way and be thorough in their work, they will probably find bee-keeping to be one of the most fascinating occupations in which they were ever engaged, and I should not be surprised if they found that the bees were the most profitable stock on the farm. W. Z. HUTCHINSON.

Genesee Co., Mich.

Field Crops.

POTATOES.

Originating; Propitious Surroundings, Etc.

WILL you please request the originator of the White Elephant Potato to give the public a careful history of its origin? I am sure it will be instructive, and illustrate the incidents of the comparative experiment given below. The very small tuber of the White Elephant received from the RURAL was cut into thirteen pieces; at the same time I planted with it thirteen eyes of the Grange Potato from a tuber of the same weight, each kind 18 inches apart in the rows, and the rows three feet apart. The treatment, culture, soil and conditions were as nearly alike as I could make them—fairly propitious. No extra manure was given either, and both received simply common field culture. I have weighed to day the product, and eaten for my dinner one tuber of each variety. The yield of the White Elephant weighed 37 pounds; that of the

Grange, 41 pounds. I have grown hills weighing ten pounds, three feet each way; of each there were really only 12 hills; for one W. E. hill having failed, I pulled up one of the Grange to make the experiment even. While the White Elephant is certainly a fine potato, it falls short of the quality of the Grange: as in most long potatoes, one end is deficient in starch. Though the yield is in favor of the Grange, the experiment repeated next year might result the other way. It is evident that there is something extraordinary in the vigor and yield of these two varieties, and this induces me to call for the history of the White Elephant.

The Grange having originated with me, I here give the history of its origin: A year or two after the Rose was sent out, in digging a patch of them, I discovered a hill that had sported, and was two or three weeks later than the Rose: weight six pounds. I cultivated the product several years, and finally discarded the variety, because, although it was healthier and yielded more than Thorburn's Rose, it lacked the beauty and smoothness of that variety. The last season on which I grew them, I found a small seed-ball, and from this I originated the Grange in the following manner: While burning, in the Spring, brush that had been used to cover beds of grape-vines in my nursery, I conceived the idea of throwing on soil and burning it, and with its aid growing my seedling potatoes when transferred from the hot-bed. The burned soil was mixed freely in the hills, and I am of the opinion that the Grange owes much of its vigor and health to this burned soil.

Here comes up the important question—what is manure? Mainly the gases generated and left in the soil by oxidation, which is a slow fire. The feeding roots of plants cannot take up actual manure, but only the minerals and gases left after decay, dissolved and absorbed by rain water. Here were the conditions and propitious surroundings that resulted in producing one of these extraordinary potatoes. During the two months of drought here this season, the Grange stood up and grew right along, better than any of the fifteen varieties with which it was tested. It does much better in dry, than wet seasons. The reason for this is found in the nature of its foliage. The leaves are small, very tough, and durable; so much so that the beetles work less upon it than upon any other variety; they leave it for more succulent foliage. Towards the tops of the vines the leaves are small; near the ground they are larger, and spread out so as to shade the soil completely. It will be seen that here is a lesson for farmers in utilizing brush and rubbish. May it not be that the same manures can be obtained from burning rubbish and securing the gaseous products by impregnating the soil with them, as by rotting stable manure, with the exception of the larger amount of mineral matter from the stable refuse? I think the creosote left in the soil also aided in warding off both insects and sporadic diseases. The fact of the parent plant being a sport probably also added an impulse that may well be carefully considered. To confirm my own impressions I will add that a short time ago I met Mr. Skeels, ex-Secretary of the American Agricultural Society, and he remarked that if he had planted all Grange instead of Rose and some others, he would have had 100 bushels to sell, instead of, as now, buying for his own use.

A. M. Purdy, of Palmyra, has grown the Grange several years, and says he has grown largely of the leading sorts, but not one of them begins to yield such a crop of large, fine, uniform tubers as the Grange. We believe it to be *the most productive potato in existence*. It is for the benefit of our farmers that I commend these two potatoes for a main crop. They seem to be our best dry-weather potatoes. I have not a single cent's interest in the dissemination of either.

D. S. MARVIN.

The Herdsman.

NOTES BY A STOCKMAN.

THE fruits of an exhibition of live stock cannot be justly measured by the profits made directly by the show. If this were the chief end of the exhibitors the show would degenerate into a sort of hippodrome; a show-ring not a bit more elevated in character than Barnum's exhibition of his fat woman, or his woolly horse. A live stock exhibition is a sort of mutual-improvement association for the benefit of stock owners. And it is a right result of the recent Chicago fat cattle show that the breeders of high-class cattle are filled with a spirit of emulation and a desire to achieve greater things in the future.

I HAVE already mentioned that to prove what a breed of cattle is really worth, a number of choice specimens should be fed for slaughtering. This is the chief end of a Short-horn, Hereford, or a polled beast, and any other purpose for which they may be put on exhibition degenerates them to mere fancy stock—playthings for millionaires. It is a gratifying thing to note that the principal breeders of Herefords have pledged themselves to "steer" 50 of their best bull calves and 200 of their best grade calves for future exhibitions. This is the right course, and these men will certainly find their reward in it.

SHORT-HORN breeders are also taking this course, and those of Ohio are reported as having formed an association for the purpose of preparing some of their best stock for exhibition, to compete with the Kentucky and Illinois breeders. And these may find in the cattle from the rich Ohio pastures and corn fields, some beeves that will tax all their efforts to beat. This will put the finishing stone on the edifice begun by the old importing association of Ohio of many years ago.

THE Canadian Short-horn breeders, too, are restive under the control of the publishers of the private herd book of the Ontario Agricultural and Arts Association. A private association, or a party, who publishes a herd-book has an interest conflicting with those of the breeders. This should be obvious, because the profits are measured by the number of entries, and to augment this number, there is always a temptation to let in entries of a doubtful character; and this is antagonistic to the breeders' interests. The inevitable result is already near at hand in the Dominion, as it is in the United States, and as it has already been consummated in England: viz., that the breeders will control their own herd-books. The Canadians have already resolved "that it is necessary to publish a herd-book completely under their own control," and have declined to entertain any offers looking to a different conclusion, from the present herd-book publishers.

HOG CHOLERA is making frightful ravages in the West. The hog crop of Iowa, for instance, is reported as being 40 per cent. deficient from these losses. How long will Western farmers continue to ignore the plain teachings of experience? The prophet's prescription, "go wash and be clean," applies to this case. Cleanliness is the patent remedy needed, and farmers may call upon the makers and compounders of nostrums and physic until doomsday, in vain, while they neglect the necessary sanitary precautions. It is a case for prevention, and not one for cure. No medicine will cure a contagious or infectious disease like this which is akin to the dreaded human cholera, and other epidemics produced by poisonous filth. A radical change must be made in keeping and feeding swine before hog cholera can be abolished. The nature of the disease is so well known that no other opinion can be justly formed, and the offers of fortunes to the discoverers of remedies that will cure it will be without result and futile, because that is working at the wrong end: at the fruit and leaf instead of at the root. And the means used must be general, or they will be ineffective. No sporadic attempts at prevention will avail; every hog owner and feeder must enter into the necessary combination, for the work of a portion only will utterly fail. The disease must be stamped out.

THE Northern Pacific Railroad has become a feeder of the Eastern cattle markets. Thousands of Montana sheep are now being shipped eastward; and Eastern sheep owners must look for increased competition from this direction, and prepare to meet it, or they, too, must go West.

THE demand for mutton for Summer consumption in every town and village is a thing to be cultivated by farmers. A flock of sheep is safe to pay 100 per cent. profit in the hands of a competent manager. Every week a few head of fat sheep might go to the butcher for local consumption during the hot weather, when beef is less salable, and in this way the surplus of a considerable flock might be worked off. But the dogs! When sheep are more numerously kept than dogs, the dog question will be satisfactorily disposed of.

THE question of the most profitable stock in proportion to the quantity and kind of feed consumed has never yet been definitely settled. It is quite certain, however, that swine consume more food, and a more valuable kind of food, under our present system of feeding them, than any other of our domestic animals. It has been said over and over again that 60 pounds of corn will or should produce 10 to 15 pounds of pork. But this is a partial statement, and requires revision. What amount of corn is required to bring a hog from its birth up to a weight of 300 pounds? This is a question upon which we have no decisive information, but yet it is a very important one. Again, how much cheaper could the 300-pound hog be produced if half its food consisted of roots, mangels, or sugar beets, for instance, for the growth of which the American climate is admirably suited. And further, how much less cholera would there be among Western hogs if half their food consisted of these roots? The facts are, doubtless, that in general, a bushel of corn will not or does not produce 10 pounds of pork, and that continuous corn feeding is one of the chief causes, if not *the* chief cause, of the losses by cholera.

SOME of the Illinois papers are hard set to find excuses for the recent embargo placed upon the entry of cattle into that State by the Governor. They are going as far as England for an excuse for the foolish and ineffective mistake that has been made: and "the dreaded foot-and-mouth disease" is the text of the excuse. There never has been a week and never a parish in the whole of England, but foot and-mouth disease has prevailed then and there for years past. But we have none of it here, simply because it cannot exist here from climatic conditions. Our dry climate and less luxuriant feed, and the absence of the common stall-feeding, or keeping on manure heaps in covered yards, are all antagonistic to this disease, and it is not at all dreaded here. And it would never trouble Illinois if a thousand or two "foot-and-mouth" calves were turned loose on the prairies, for that in itself would cure this dreaded disease.

Miscellaneous.

What Others Say.

Dr. James R. Nichols kindly calls our attention to a paper read by him before the Massachusetts State Board of Agriculture, in answer to several questions which we had occasion to ask him in relation to the muck controversy The entire address is well-considered and instructive. We regret that, in the crowded state of our columns, we can find space only for the more important parts. The RURAL hopes to be able to put before its readers additional evidence as to the actual value of muck.

MUCK PROPER.—Muck, considered as the most advanced of all bog deposits, is easily recognized by its peculiar physical conditions, and we have now to consider its value as a manurial agent. The large amount of water mixed with muck in its natural state, is a most serious obstacle to its farm employment. It may be stated to hold a minimum of 60 per cent., and a maximum of 92 per cent., the average being, in New England mucks, not far from 85 per cent. of water. To cut out a water-soaked substance like this, from a treacherous, spongy bog, lift it into carts, and carry it long distances, involves great labor and expense. If it is allowed to air dry on the spot where exhumed, some advantage is gained, but it must be remembered that under the most favorable weather and conditions for drying, much water remains to be transported. Experiments at my farm upon air-dried mucks, extended over five seasons, showed that water remained in the material to an extent varying from 30 to 47 per cent. It is probable that not many farmers have ever seen a specimen of absolutely dry muck; that is, such specimens as the chemist has in hand in making his analysis in the laboratory. The absolute water-free muck is a light substance usually, which the wind will scatter as it does a handfull of feathers. . . . . It is plain that a substance so under the constant influence and action of water can contain no ingredients *soluble* in that fluid; and hence we fail to find in the ash of muck, any of the soluble forms of plant food. None of the valuable soluble salts of potash, soda, or phosphoric acid are present in the muck bed, unless in extremely minute quantities. In soils on higher lands, the humus and ash contain all those soluble agents derived from the decay of vegetation. It must be kept in mind that vegetation decays *in water* under different conditions from that when exposed to air, or in the presence of oxygen, and a different condition of the resultant mass must be expected.

The greater portion of the inorganic material of muck is lime in its insoluble form, silicia, iron, alumina, and often magnesia. Of the alkaline earths, lime is present in greatest abundance. From a careful consideration of the results of analyses of a large number of specimens of muck, made during the past quarter of a century, under my observation, I have no hesitation in saying *that the ashes of muck are practically worthless to the farmer as a source of plant food.* I say *practically* worthless, meaning by this, that the inorganic constituents of mucks contain so little of valuable, available, plant nutriment, that if they held no other forms, they would be utterly unworthy of attention, even under the most favorable conditions. This view is sustained by the investigations of Kane, Sullivan, Vaux, Regnault, Mulder, Baer, Peterson, Anderson, Wagner, and many other eminent chemists in Europe, and Johnson, Storer, and other chemists in this country; in short, it is sustained by the analysis of every competent chemist whose researches have extended in that direction.

NITROGEN IN MUCK.—As regards the other forms of valuable plant food contained in muck, I have only to consider *nitrogen*. All analyses prove the presence of potential nitrogen in mucks, and in some it is found in considerable quantities. The form in which it exists is in combination with organic acids, the humic, ulmic, crenic and apocrenic. It has been alleged that free ammonia has been found in some bogs, but I have failed to detect it in any specimens coming under notice, and no reliable chemist, so far as I can learn, has declared its presence. Nitrogen is the most costly, and, indeed, the most valuable, of all forms of nutriment needed by plants, and the question of its value, as found in mucks, is one of high importance in this discussion.

ANALYSIS OF MUCKS.—In the table of analysis presented below, a clear view is given of the amount found in three typical specimens of muck, one of which is from a bog on my farm at Winnekeni, one from a remarkable deposit in Boxford, Mass., the other from a well known bog in Plaistow, N. H. The equivalent in ammonia (NH_3) is also presented.

	Nitrogen.	Ammonia.
Winnekeni farm, per cent.	0.56	0.68
Plaistow, N. H., " "	0.31	0.37
Boxford, Mass., " "	0.50	0.61

The above is as found in the *wet* condition. In the *water-free* state it stands as follows:

	Nitrogen.	Ammonia.
Winnekeni farm, per cent.	2.47	3.00
Plaistow, N. H., " "	2.13	2.55
Boxford, Mass., " "	2.12	2.59

The average of fifteen determinations of nitrogen in wet mucks, by Prof. Johnson, is.....0.42
Water-free.....2.31

. . . . Taking muck beds as they are found in the Northern States, it will be safe to assume that they hold on an average, in the absolutely dry condition, about two and a-quarter pounds (2¼ lbs.) of potential nitrogen in each one hundred pounds. . . . . A specimen from my farm meadow contains in each ton (2,000 pounds), of *water-free* muck, 49.40 pounds; this at 15 cents (a fair price), gives a money value of $7.41 for the nitrogen. The value of all the mineral and nitrogeneous plant food it contains may be stated as follows:

Nitrogen	7.41
Lime	.30
Other salts	.10
	$7.81

The cost of procuring one ton of absolutely dry muck, may be understood from the fact that *ten tons* of the wet mass are required, estimating the water at 90 per cent., which is a fair average for successive seasons. A ton of wet meadow muck of the best quality, is thus shown to have a value of seventy-eight cents (78 cents) as fertilizing material for farm crops, estimating its mineral plant-food constituents as we estimate that found in cow dung.

ANALYSIS OF COW MANURE.—With the view of affording a comparison of muck with fresh dung, a sample taken from my barn stalls, the droppings from cows in milk, is here presented. It contained of

Water	81.08
Organic matter	15.96
Ash	2.96
	100.00

The result of this examination may appear somewhat startling inasmuch as it shows that the fresh cow dung from the barn, contains *more* water and *less* organic matter and ash than is found in muck on the farm 40 rods distant. It would appear (other things being equal) that the muck is as valuable, or even more valuable than the dung, but important considerations come in to dispel this illusion. A complete analysis gave, as contained in each ton of the fresh dung, the following amounts of valuable constituents.

Nitrogen	5.11 lbs
Phosphoric acid	3.55 "
Potash	2.00 "

The nitrogen in manure has a higher value than that in muck, but estimating it the same, with the phosphoric acid, potash, etc., the value stands as follows:

5 1-10 lbs. of Nitrogen	15	76
3½ lbs. of Phosphoric acid	12	42
2 lbs. of Potash	7	14
Lime and other salts		33
		$1.65

ANALYSIS OF LIQUID EXCREMENT.—The nitrogenous and mineral value of muck stands to fresh cow dung as 78 cents to $1.65 per ton, water-soaked; or nearly three to one in favor of the latter; but it must be remembered that fresh cattle droppings do not represent *manure* as found in farmers' barn cellars. This consists of a mixture of the *liquid* excrement with the solid. A ton of fresh urine, as determined in analysis from specimens collected at my barn, gave the following results:

Nitrogen	17.5 lbs.
Phosphoric acid	10.12 "
Potash	15. 9 "

This result indicates the very high value of liquid manures, giving a value per ton of about $5, the estimate being made in accordance with that for muck and for solid excrement. A ton of well mixed manure, containing equal proportions of the solids and liquids, has a money value of not far from *four dollars*, or, this is the value of the manure stored in the barn cellar at Winnekeni farm, as learned from analysis.

W. W. TRACY, in answer to a question how best to preserve onions, has this to say in the Michigan Farmer: The onions are stored one to two feet deep on the tight floor of some barn or shed (the loft of a barn is frequently fitted up for the purpose), but kept at least two feet from the sides of the building. They are left exposed until chilled or actually frozen, and then covered with about one foot of straw or marsh hay, the space between the wall and the onions being tamped solid. In putting on the hay care is taken not to disturb the onions in the least by stepping on them, but the hay is thrown on from the outside. As the cold increases more covering is added, until by mid-Winter it is three or four feet thick and the onions are left severely alone until the approach of Spring, when the covering is gradually removed and the bulbs are usually found in the best of condition. The object in this method is to have the onions as dry as possible and then to chill or freeze them and keep them frozen until wanted, at the same time protecting them from the warm damp weather of a thaw, and preventing their being moved when frozen; this last is considered very important.

THE Massachussetts Ploughman reasons that if the potato was the true seed there would be but little doubt that planting the largest and best specimens would result in the improvement of the quality of the product. But as they are not the true seed, are not a new life secured through the principle of reproduction, but simple a continuation of the old life secured by a continuation of vegetable growth, there is but little more certainty of getting large potatoes, by planting large ones for seed, than there would be of getting large apples by setting large cions.

COTTON-SEED MEAL, says Prof. Atwater, if decorticated (the tough husk of the seed taken off) and in good condition, is a very valuable food. But it must not be fed in large quantity—not more than four to six pounds can profitably be given to a steer or cow per day. It ought to be purchased anywhere in the West for $1.25 per 100 pounds. It is exported in large quantities to England, and used as a fattening food for cattle. If mixed with corn and bran, let the proportions be 100 pounds corn, 80 pounds bran, and 69 pounds cotton-seed meal, or 60 pounds of flax-seed meal, and then feed of the mixture all the cattle require. Glucose meal is better if mixed with some corn, this meal having about the same composition as bran.

No finer English fruit than mine goes to Covent Garden, says a writer signing himself "A Victim to Pomona," in the London Chronicle. Twenty-five years have I now been a fruit-grower, and in one season only has the produce paid the wages, let alone manure, repairs, interest on capital, etc. . . . . .

"MAMMA, where do the cows get their milk?" inquired Willie. "Where do you get your tears, my son?" "Mamma, do the cows have to be spanked?" thoughtfully inquired Willie.

Farmers' Colleges.

I was much interested and pleased with Dr. J. R. Nichols's remarks on "Farmers' Colleges" November 26. p. 798. It is evident to farmers that his "head is level." We also need some such schools for farmers' sons of 20 and near that age or older, who would like to get more light; but cannot spend four years studying algebra, geometry, and military drill, etc., while if they could attend a course in the Winter, taking up some of the studies closely connected with practical farming, like chemistry, etc., many who could not leave the farm in the Summer, would gladly spend part of one or even more than one Winter in attending such a practical course. I am glad that some of these scientific fellows like Dr. Nichols are awaking up to what we farmers need. Those who expect to hold the plow and also themselves drive some of the time cannot afford to spend much time on superfluities. Let us hear more on the subject. In closing I will say that I read six agricultural papers, but the RURAL NEW-YORKER is decidedly the *best*. EVERETT E. BROWN.

Windham County, Connecticut.

A Suggestion.

To dig a ditch with a uniform grade on the bottom, in land that is uneven on the surface, is very difficult unless one knows how. I will give you a plan that I originated myself. It has never been in print. At the head of the ditch drive a stout stake, and at a distance of ten or twenty rods farther up, and on a line with the ditch, drive another. Nail a narrow strip—a lath will answer—across the first stake, on the side next the outlet, just as high above the bottom of the ditch as the eyes of the digger. Then let him who is to dig the ditch go to the outlet and look across the lath and direct his assistant to nail another strip on the second stake, in a line with the first. Now, to find the grade in any part of the ditch, it is only necessary for the man to stand up straight and look at the two strips. If they are in line, his feet are on grade.

In cases where there is not an opportunity to sight in this manner, as in digging a cellar drain, I have adopted the following method: Stretch a line at a certain distance above the bottom of the ditch and at one side, so as not to be in the way, and with your measure you can keep just so far below the line. If at any place the ditch should be inadvertently dug too deep, it is important that it be brought to a true grade and tamped, lest the tile settle and become filled. M. CRAWFORD.

Summit Co., O.

Everywhere.

RURAL SPECIAL REPORTS.

Arkansas.

WALNUT RIDGE, Lawrence Co., Dec. 10.—Times are hard here on account of last season's drought. Prices of everything in the food and feed line are high: corn, $1.15@1.25 per bushel; Irish potatoes, $2; sweet potatoes, $1.25 per bushel; turnips, 60c. per bushel, and eggs, 20c. per doz.; butter, 25@35c. per pound; pork, 8c. per pound and beef 5@6c. W. S.

Indiana.

INDIANAPOLIS, Marion Co., Dec. 12.—Not an asparagus seed came up. Sowed Washing-Oats April 22, in drills 110 feet long; grew very well, but smutted badly. [This seems to be the general report.—EDS.] May 11, planted three rows of Branching Sorghum 110 feet long, four feet apart; hills, 18 inches asunder; one to three seeds in hill Came up exceedingly well; when three to four inches high, thinned to one plant in a hill. Owing to our extreme and unparalleled drought from June 8 to Aug. 31, it made slow growth, at latter date not much of it having attained a hight of three feet. At that time we had a drenching rain, which caused it to shoot up wonderfully, some of it reaching a hight of eight to nine feet in the next two months. One hill made 23 *heavy* branches, the whole averaging 10 to 12 stalks; but few stalks showed any signs of seed; none matured. On Oct. 27 I cut an average hill of 10 stalks: weight, 7½ pounds—an average of over 27 tons per acre. Not a blade curled during our long period of more than 10 weeks of terrible drought and heat, while evergreen corn alongside curled every day as tight as a paper lamp-lighter. About Aug. 20 some bottom leaves began to dry, and fearing it was all going the same way, I began cutting and feeding to my cow a few hills daily, and the way the new shoots started after our rain on Aug. 20 was a surprise to all beholders, as was the whole crop, which has been cut at intervals since Oct. 15, and fed to and devoured with apparently keen relish by my cow and horses, not five pounds of the coarsest stalks having been refused. Perhaps it should be stated that the heavy, hard stalks were cut short with a lever cutter. What would my crop have been with timely rains! I have spun this Sorghum matter to a considerable length, for I regard it as an exceedingly valuable fodder plant, especially for soiling. On May 18, brought White Elephant from cellar; removed five sprouts and planted them; cut potato to 14 eyes; planted them 15 inches apart in drill slightly scooped out, leaving the bed rather firm; put on the eyes and covered with half a peck of thoroughly decomposed chip manure sifted, then some short litter, then loam. Two sprouts and seven eyes grew. Hoed and kept clean. After I had overcome the ravages of the beetle and the rains came, the vines grew vigorously and were very green on Oct. 18, when I dug five pounds, mostly very small potatoes; there was but one fair-sized and handsomely formed tuber in the lot. W. B. P.

Iowa.

LADORA, Iowa Co., Dec. 10.—I divided the White Elephant with a neighbor. From the four eyes I had left, I got a peck measure about even full of very handsome potatoes. Last Winter was very hard on the Cuthbert Raspberries. I had one (Cuban Queen) melon that weighed 29 pounds, another 33 pounds. Corn, wheat and potatoes in this neighborhood each about one-fourth of a crop J. W.

Kansas.

GARDEN PLAIN, Sedgwick Co., Dec. 13.—Both kinds of asparagus grew splendidly. It was too dry for the flower seeds. The oats I did not sow, neither did I the Sorghum. I gave A. M. George half of the White Elephant Potato. He cut it into six pieces, one eye in a piece, and put the pieces into a small stone jar filled with sand. When they sprouted, he took the sprouts off, and set them out. The weather being very dry, they did not all grow. He dug them the 19th of October and got 34 pounds. One weighed 1¾ pound; another 1¼ pound. Some were cooked and proved excellent. He thinks if he had received the potato in February he could have increased the crop half or two-thirds as one potato out of a hill planted in July weighed 1¾ pound. The product of my half was destroyed before maturing. H. E. S.

NORTON, Norton Co., Dec. 15.—This has been a harder season on the settlers of this county than last. A railroad that is being built through the county has enabled many to earn money to "keep a-going," but few have anything to sell. Flour, $3.50; wheat, 85c.; corn, 75c.; meal, $2.20—so little of the corn is fit to grind. My corn averaged 2½ bushels per acre! I cut my "Elephant" into 10 pieces; planted them in two hills; watered the hills during the driest part of the season, and when I dug them (the hills) I did not find a potato, not even the size of a pea! I think if any set, some grub or worm must have eaten them. Only two of the Rural Branching Sorghum seeds grew. The Doura, which I had kept over from last year's distribution, did much better—grew higher and larger. During the latter part of the season the chinch-bug attacked both, and when they were dead to about 18 inches above the ground I cut them up for fodder. A hill that I had previously cut—to see it sprout again—never sprouted, owing to the chinch-bug, probably. The asparagus and flowers did reasonably well, but I think that our soil, while fertile, is almost too "raw" yet for small seeds. D. E. S.

Michigan.

JONESVILLE, Hillsdale Co., Dec. 12.—The White Elephant Potato weighed two ounces; from it I raised 20 pounds of very nice tubers. I would not take five dollars for them. H. B.

Minnesota.

CEDAR MILLS, Meeker Co., Dec. 14.—The Rural Branching Sorghum was planted about May 10. The seeds all came up and grew finely from the start. Did not look yellow. The cows ate it greedily, preferring it to green corn fodder. It is undoubtedly a good fodder plant, but not needed here, where natural meadows are so plentiful. I noticed that it remained green for two or three weeks after the frost had withered the corn blades. Only six stalks matured seed. The Washington Oats grew well, but rusted badly and the stalks fell down before the seed ripened. The White Elephant Potato under the circumstances has done well, as I did not expect even one pound after I found that the Colorado beetles had killed the vines before they had blossomed, but there were nearly eight pounds when I dug them. I think that every asparagus seed came up, and all have grown nicely. The picotees and carnations germinated well, though planted very late, when the weather was hot, about the middle of June, but I drenched the bed well and covered it with boards to keep it moist. This enticed the ants and I had to make war on them with boiling water, losing a few plants in this way; but I have a nice lot of plants and the picotees bloomed finely all the Fall. They were mostly very double, and even the single ones were very large and fine. I found that my pentstemon and iris seeds planted in the open ground late last year, came up last Spring, and are now fine plants. I feel quite sure that all the failures I have ever had with RURAL seeds (and they are not many) have been from too much water in the boxes or pots. Once they were too dry. John wishes me to say that he prizes Blount's Corn and considers it the most prolific of any variety that he has cultivated. The first year the seed did not mature, but grew all right. The second year a part only matured, but this year it all ripened well, some of it as early as the first of September. M. E. M. B.

NEW YORK MILLS, Otter Tail Co., Dec. 12.—My White Elephant Potato had six eyes five of which grew, making five hills. Had a great fight with the potato bugs, but got one peck of nice tubers; several weighed a pound and one two pounds; have not tried any yet as I am keeping all for seed next year. It is a race between the Elephant and the Beauty for the first place in my regard. The Washington Oats grew finely but turned out just half smut, which I pulled up as fast as it headed. I have half a peck of oats for seed. The Rural Branching Sorghum grew eight feet high; two stalks headed out. The asparagus grew about two feet high. The flowers are fine. My land is black loam with a clay subsoil. It is new ground, the last being the first crop. We are all homesteaders here on the Northern Pacific R. R. T. D. A.

New York.

CARTHAGE, Jefferson Co., Dec. 14.—The RURAL free seeds came in good condition. I planted the White Elephant Potato, cut into 12 pieces, an eye in each piece. At the time of planting there were two sprouts grown from it, about three or four inches in length, and I planted these one in a hill, making 14 hills. The sprouts grew as strongly and thriftily as the other hills, and the yield was about the same. From the 14 hills I had 48 pounds of nice, large tubers. The Branching Sorghum did not ripen any seed, but grew well. The oats gave a good yield, and the asparagus did finely, although the dronght was quite severe in this vicinity. The flower seeds were not sown on account of our inability to prepare the beds until too late; for, as the Spring was later than usual, we were extremely busy. J. V.

CASTLETON, Renssalaer Co., Dec. 9.—The Mold's Oats I consider very valuable. The Cuthbert Raspberry I consider something extra and quite hardy. I have now about 30 plants from the two. The pentstemons and willows are very fine. I have over 30 iris plants. The Washington Oats were badly smutted but the White Elephant made up for them. I received a two-ounce potato which was smashed in the mail; but I cut it into 13 pieces with one eye in each, and planted them with the main crop, the hills three feet apart, and dug 25 pounds of tubers. The pinks and picotees were elegant. F. O.

Pennsylvania.

HORN BROOK, Bradford Co., Dec. 12.—The melons from last year's Free Seed Distribution were splendid, and the hollyhocks bloomed finely this year. The hibiscus did not do well. Two of the evergreens came up, but that was all. They died; so did the Man-root. The magnolias did not come up. This year the melons were nice. The pinks were very pretty and are looking fine now, but mine were not as handsome, nor was there such a variety of them, as I saw in the garden of another RURAL reader. The celery is the best I ever saw. The tomatoes were good, but were affected with the rot, and I have one of the tree seeds that came up and grew about four inches. I hope it may live. We have had hardly enough snow to cover the ground, and it melted off the next day; but now the ground is freezing and it looks like snow. Some of the flower seeds did not come up in consequence of not being planted early enough to get a start before the dry weather came upon us. But, taking them all together, I feel very well satisfied; but I hope to do better next year. T. G. T.

Tennessee.

NASHVILLE, Davidson Co., Dec. 12.—I got *nearly* (not quite) a barrel of White Elephants—*good ones*. J. J. P.

Wisconsin.

CASSVILLE, Grant Co., Dec. 8.—My White Elephant Potato I planted in good garden soil in ten hills. It yielded about half a bushel of nice tubers; one weighed eighteen ounces, and three weighed one pound each. I planted Early Rose and Victor potatoes at the same time and in the same manner. The Early Rose yielded less, and the Victor more than the White Elephant; but the Victor is not a first-class potato. I have sufficient asparagus plants to set out a good-sized bed. Winter wheat all killed out, rye nearly so. Oats one-third of a crop. I had 70 acres; yield 1,112 bushels. Of corn I had 50 acres; yield 40 bushels per acre. Flax seed turned out eight to eleven bushels per acre. Hay was a good crop; I had about 40 tons from 18 acres of bottom land. Very little Spring wheat sown, but what was sown the chinch bugs killed. There was a large amount of clover cut for seed, but wet weather spoiled three-quarters of it. Dairying is fast taking the place of wheat raising hereabouts; quite a considerable number are fattening cattle; others turn their attention to sheep, while all fatten hogs more or less; but the hog cholera has been troublesome for two years. A good many farmers are raising "half grade" Percheron horses. Heavy horses sell well here. This is a good stock country. There is plenty of good water, and stock generally are healthy. I show the RURAL to my neighbors, which is as good a recommendation as I can give it. All who have seen it are pleased with it. I have always taken an agricultural paper, but the RURAL which I subscribed for the first time a year ago, pleases me better than any I have ever seen. J. W. T.

MINERAL POINT, Iowa Co., Dec. 16.—Planted the White Elephant Potato one eye in a hill; 16 hills; yield half a bushel of nice tubers. The oats grew four feet high, and yielded two quarts of good grain. The Rural Branching Sorghum grew 10 feet high with 10 to 16 stalks in a hill; seed matured on a few heads. The asparagus did not all grow, but there is enough to give it a fair trial next season. The flower seeds grow into handsome flow-ers. E. G. R.

THE
RURAL NEW-YORKER,
A National Journal for Country and Suburban Homes,
PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, NEW YORK.

SATURDAY, DEC. 31, 1881.

ANNOUNCEMENTS.

THE Bonanza Farm series of articles and illustrations will be begun early in January, beginning with the portrait of Mr. Oliver Dalrymple and a sketch of his life. The portrait will be printed upon heavy supercalendered paper as a supplement. The second of the series of illustrations will be Breaking; the third Backsetting; the fourth, Seeding; the fifth, Harrowing; the sixth, Harvesting, and the last Thrashing. Mr. Dalrymple informed our special correspondents that this is the first time he has ever given comprehensive notes of his methods of farming to the public, and that all other writings upon the subject have been from desultory information, and most of it wide of the truth.

WE take much pleasure in announcing to our readers that the distinguished American horticulturist, Dr. John A. Warder, is preparing a series of articles for the RURAL NEW-YORKER on Forestry. The following subjects will be specially treated:

Water-Supply of a Country—How affected by Forests; Results of Clearing. Torrents; Overflows.

Where to Plant—Preparation of the Land.

Planting—What and How; Massing; Mingling; Grouping.

Cultivation—-Protection—-Fencing—-Fires.

After-Treatment—Thinning, &c.

Felling—Harvesting.

Systems of Management.

Secondary Products—Bark, Pitch, etc.

Conservation or Planting Anew.

Natural Reproduction.

Coppice Wood—-Management; Time for Cutting.

Cheap and Hardy Trees—Pioneers for the Prairies.

Soft-Woods—Poplars, Willows, etc.

Catalpas.

Hard-Woods—Oaks, Hickories, Walnuts.

Maples, Ash, Cherry, Elms, Buttonwood. Beeches, Birches, Iron-woods, Alders, Honey-Locust, Ailanthus, Black-Locust, Chestnuts, Magnolias, Tulip-Tree, Sassafras, Sumac, Thorns, Plums, Crabs, Viburnums, Mountain Ash, etc., etc.

Miscellaneous and Novelties from Abroad.

Conifers and Evergreens.

Our Pines; Spruces; Firs; "Cedars;" Larches; Cypresses; Thujas, etc.

Undergrowth—Dogwood, Hazel, etc.

Insects and Enemies.

Local Plantations already started—Larch Dale, Illinois; Messrs. Fay's Estates in Massachusetts; Pine Forests of Cape Cod; Scofield's, Elgin, Illinois; Larch Wood, Iowa; Col. Whiting's, Iowa.

Shelter Belts—Wind-Breaks.

Black-Locust Groves of Ohio.

Dr. Warder's Experiments, etc., etc.

PROFESSOR A. E. BLOUNT will commence early in the New Year a series of articles on Colorado farming, wheat growing, etc.

MR. WALDO F. BROWN, the veteran farmer of Butler County, Ohio, will shortly begin a series of articles in the RURAL NEW-YORKER upon the following topics:

How to Raise Pigs—Illustrated.

How to make Cheap Pork, adapted especially for the corn farms of the West.

Breeds and Crosses.

Recollections of Hog Driving.

MR. HENRY STEWART, as has already been announced, will begin his farm novel, founded on fact, entitled "The Story of Stony Brook Farm," as soon as our present story closes.

THE well-known Professor A. J. Cook begins with the New Year a series of articles on bees and honey. Professor Cook has for 14 years been an earnest student of apiculture, carrying forward for the entire period experiments that had for their object the development of the science and improvement of the art. For the past thirteen years he has been a lecturer on bee-keeping at the Michigan Agricultural College, Superintendent of the College Apiary, which has paid from 100 to 500 per cent. on the capital invested; President of the Michigan State and of the National Bee-Keepers' Associations. He is the author of what everywhere is acknowledged as the most complete work on apiculture in the world, and his Manual of the Apiary is thought, both in Europe and America, to be the most complete work extant on this subject.

WE DID NOT DO AN INJUSTICE.

IN the RURAL of November 12, in commenting on Gov. Cullom's restrictions on the importation of cattle into Illinois from certain scheduled districts in the Atlantic States, we said:

"The Treasury Cattle Commission at first recommended that the entire States should be scheduled in any part of which the disease existed; we protested against such an embargo as too sweeping, and we are pleased to see that Gov. Cullom has prohibited importations only from the infected counties, thus greatly diminishing the embargoed area."

In reference to these remarks the following note from Mr. J. H. Sanders, Secretary of the Treasury Cattle Commission, appeared in our issue of November 26.

"Referring to your paper of Nov. 12, page 768, bottom of last column, permit me to say you are greatly mistaken as to what this Commission recommended to the Governor of Illinois, and your article does us injustice. We recommended to the Governor just what he has done, no more and no less. We never thought of urging him to schedule any State entire."

In the editorial in which this note was published we pithily stated our action with regard to the laudable desire of Western men to protect their herds from possible contagion, and we concluded the article with the same inquiry with which it began—"Have we done an injustice?"

Curiously enough two of the Commissioners who, of all men, know best what measures were really recommended to the Governor, have decided that we were *not* guilty of an injustice in the above statement, and these two are Prof. James Law, the President of Commission and Mr. J. H. Sanders, its Secretary. In the issue of Dec. 15 of the Breeder's Gazette, owned and edited by the latter, is a long article by the former on "Contagious Pneumonia—Cattle Owners and Congress." On page 55, first column, in speaking of the impossibility of impressing those in authority with the stringency and comprehensiveness of the measures needed to suppress the disease, Prof. Law says:

"Even Gov. Cullom, of Illinois, who, at the instance of the Treasury Cattle Commission so nobly came out with a proclamation forbidding the introduction of cattle into his State from the infected counties in the East, yet failed to see the importance of proscribing an area wider than the individual counties infected. * * * Had he, *as advised by the Commission*, proscribed all parts of the infected States lying east of the Alleghanies, or if that is illegal, the whole area of each infected State, he would have instituted a sound protective measure."

Mr. J. H. Sanders, Secretary of the Commission, indorses this statement of the case by allowing it to appear in his own paper without the protest which, had Prof. Law misstated the case, he would certainly, under the circumstances, have editorially made, especially as particular attention is called to the article in the leading editorial, on page 60, of the same issue. If the omission is due to courtesy, absence, forgetfulness, oversight, carelessness or policy, then the statements made by the President and Secretary, of what measures were really recommended to the Governor, differ so widely that it will not be easy even for the acknowledged ability of these gentlemen to reconcile them; if, on the other hand, the omission is due to a clearer comprehension or a better recollection of the recommendations made, then we are certainly exonorated from the inconsiderate charge of having done an injustice to the Commission whose appointment and composition we approved.

OUR INDEX FOR 1881.

WITH this issue we present the index to the Fortieth Volume of the RURAL NEW-YORKER, which is brought to a successful close this month. We hardly need to speak of the convenience of such an index in a journal like the RURAL. Any periodical devoted to the consideration of practical or scientific subjects is sadly incomplete without a carefully arranged index by the aid of which the reader may turn at once to the subject on which he seeks information, and thus the tedious, and often hopeless, task, of looking through an entire volume, is avoided. But there is a difference in indexes. A properly arranged index is of the first value in facilitating the search for a particular article, while one hurriedly and carelessly thrown together may be quite as bad as none at all.

The one which accompanies this issue of the RURAL we can confidently say belongs to the former class. The compilation of it, as of those of the past three years, has required a great deal of painstaking labor, and it has been thus conveniently and carefully arranged by an expert ho for four years has had this matter in charge. Few journals give such attention to their annual indexes, and we feel assured that our endeavors to give our readers such a means of ready reference will be appreciated by them, and, if so, we shall feel that whatever skill and labor it has demanded will be amply rewarded. We have devoted the entire index space to the practical departments only, inasmuch as the contents of the literary and other departments cannot have for the farmer the permanent value which the consideration of practical topics possesses, and we have aimed to classify the subjects discussed in each article rather than the mere *title* of the same, and whenever it has seemed necessary to promote ease of reference or to avoid ambiguity, the same topic has been placed in the index under more than one heading.

In the above remarks we have gone on the supposition that most of our subscribers preserve the numbers of the RURAL as they come to them from week to week and, in some way, bind them for use. In what book could so much and so authentic information on so large a variety of farm topics be found as in a single volume of the RURAL! It is as a work of reference, as, in brief, an encyclopædia of agricultural and horticultural facts, theories and experiences that the RURAL is especially valuable, and as such it should find a permanent place on every farmer's book-shelves.

OUR UNUSUALLY HIGH TEMPERATURE.

LAST Tuesday the Signal Service reported a "warm wave" averaging 30° to 40° above the mean temperature of the month and extending to the south and east from its central position in Dakota and Minnesota. This "warm wave" is only one of a series which have recently been developed in that "weather manufactory" Manitoba, Montana and Dakota. On the 6th inst, a "warm wave moving in a southeasterly track entered the United States from Dakota and Montana." Again, on December 17, a "warm wave" extending from Dakota "to the south and east" was announced with a temperature 20° above the average for the month in Minnesota and Iowa, and 30° above the average in Dakota. This anomalous weather has extended nearly all over this country, and appears to have extended even to Europe. From all quarters come predictions of an exceptionally mild Winter, and there certainly is a hopeful prospect that the "clerk of the weather" will verify the "weather seers'" cheering vaticinations. "Cold waves" will no doubt soon alternate with "warm waves," but the persistency of the latter implies the existence of very unusual causes of heat, the influence of which will probably be still felt even through January. This protracted spell of warm weather is likely to be very beneficial to the Winter wheat crop, enabling it to attain a good growth before severe cold, although owing to the drought it was sown unusually late in most parts of the country. With a snowfall sufficient to cover the crops and a moderate mean Winter temperature, the grain crops of the United States bid fair to reach an unusually high aggregate next harvest.

JUDGING at this time we shall enter upon the New Year with a full measure of encouragement. Though, for various causes, many of our old readers drop out of our lists with every recurring subscription season, we yet hope the great mass of them will continue with us through 1882 and, indeed, for many a year thereafter. With every reason to feel thankful; with every reason to feel deeply grateful to our readers who have so heartily supported us in the past, we extend to all a Happy New Year and we promise our best endeavors to make the RURAL NEW-YORKER for 1882, the thirty-second year of its age, as trustworthy, as original, as enterprising as it has ever been during any preceding year, while we shall aim to surpass all previous efforts.

THOSE who wish to ascertain the true value of ensilaged food should read the second article on this subject with which Dr. Lawes has favored us. It will be found on page 877. He concludes this article as follows: "*As regards ensilage I must confess that I do not altogether like a process which appears to be so destructive of food.*" We have as yet no reason to regret the conservative course the RURAL NEW-YORKER has followed regarding the ensilage craze.

WE have received a reply from the Prentiss Preserving company to Prof. Warders's strictures upon the Ozone advertisement. The reply is not satisfactory, and so the advertisement is rejected.

OWING to the fact that the holidays are this year celebrated on the days we go to press, the numbers for Dec. 31 and Jan. 7. will be mailed a day later.

OUR readers will bear in mind that we do not *promise* to furnish back numbers of the RURAL NEW-YORKER for any part of the new year.

SEVEN YEARLY SUBSCRIPTIONS WITH $14 ENTITLE THE SENDER TO THE RURAL NEW-YORKER FOR ONE YEAR FREE.

BREVITIES.

THE RURAL NEW-YORKER is very careful to exclude all advertisements of an uncertain or fraudulent character from its columns. Our readers would oblige us if they would mention the RURAL in all correspondence with our advertisers. Our chief reason for making this request is that our advertisers may know how well it pays them to patronize a trustworthy agricultural journal.

ACCORDING to the Department of Agriculture's report of the cotton crop, just received, the condition of the crop is lower than in any season since 1866. The general average of the condition of the crop in October, which, within certain limitations, affords the best indication of the ultimate product, was 66. The nearest approach to this condition in 15 years was in 1874, when the average was 72. In June and July the crop was within five points of the standard of last year, but when rains came, after the drought, the second crop was too late to produce much fruit. Boll worms and caterpillars also did some injury. In view of all the reports of the season up to December 1, indications point to an aggregate crop of 4,900,000 bales, with a possibility of a slight increase on this estimate.

IN the case of Carr vs. Bartlett the facts were these: Certain persons subscribed to build a cheese factory, subscriptions for which purpose were made payable to the building committee who were named in the subscription paper and who were also subscribers. One of the subscribers having refused to pay after some of the subscriptions had been paid in, the building committee sued him. The defendant pleaded that the committee had no authority to sue, and also that, as the subscription was voluntary, he was under no legal obligation to pay it. The Supreme Court of Maine in giving judgment against him the other day, through Judge Peters, said that while the undertaking was incomplete it was not binding on the defendant; it was without consideration; for it was not a sufficient consideration that others had joined in the same promise, relying on his promise. The defendant might then have withdrawn from the project, or he could continue in it until it was completed and subscriptions paid in, as in this case, but then he would be bound. The building committee were competent to sue for the subscription. Under the agreement they were to be paid, and, being themselves subscribers, they represented the association.

THE Commissioner of Agriculture in his annual report to the President says that on assuming office on July 1. last, he found an elaborate plan of operations for the year already laid out by his predecessor. Such of the investigations as he thought valuable he has been pushing forward. The Commissioner says:—"Provision had been made for investigating the agricultural condition of the Pacific coast; for continuing the work on the artesian wells in Colorado; for proceeding with the experiment in the cultivation of the tea plant; for concluding the investigation into the manufacture of sugar from sorghum; for observations of the existence of pleuro-pneumonia and other contagious diseases of animals, both in this country and in those English ports to which American cattle are exported; for continued examinations into the necessities and opportunities of American forestry; for tests of textile fibers, both animal and vegetable; for a scientific investigation of the habits of insects injurious to vegetation, and of the best methods of destroying them and for the usual work of the various divisions of the Department for which appropriations had been made by Congress." All these subjects have received careful attention, and the Commissioner is also resolved to make the crop reports more accurate and exhaustive than heretofore.

Miscellaneous.

WAHPETON, D. T.

Its Surprising Growth, and Flattering Prospects. Richland County; Rapid Settlement and Railways Bespeak Superior Natural Advantages

MESSRS. HOLMES AND SWEETLAND.

[Special Correspondents of the RURAL NEW-YORKER.]

LAST week we made brief mention of Wahpeton, promising in this issue more extended comment upon this comparatively new candidate for public favor and commercial honors. Its name and reputation have not become well known abroad, nor are they familiar even to many nearer its locality because the town is in its infancy as a railroad center, and because there has not been an effort in the "booming" process resorted to by some Western towns driven to this expedient by a deficiency of genuine attractions.

As a trading point, it became the county seat of Richland County about eight years since, and acquired but little growth until the completion of the St. P. M. & M. Railway, to the town, in 1880; but since then its development has been steady and rapid. The population at that time (June 1880), by the national census, was 100, while an enumeration completed for election purposes on November 16 of the present year, gave 613. The Congregational and Catholic societies have attractive and commodious church edifices, able pastors and good congregations; while the religious and moral sentiments of the people will find further expression in the erection of houses of worship by the Methodist, Episcopal, and Lutheran societies the coming year. There is a very happy commingling here of Eastern refinement and culture with Western nerve and enterprise, which develops itself in business and social life alike, giving to each character and permanent thrift. A school property valued at $1,500, with efficient teachers, affords requisite educational privileges The local newspapers; the Gazette semi-weekly and weekly, by E. K. Morrill; and the Times, weekly, by George P. Garred, are well edited auxiliaries to the business and educational interests of the place. The town has had a commercial business of over $500,000 the past year. An elevator, a planing mill, a bank, well stocked stores, hotels, lumber yards, a machine shop, and a brewery, are all found here. A wheat market of over 150,000 bushels the past year and permanent improvements exceeding $140,000 give one an idea of the present condition and future prospects of Wahpeton.

The site, on the western bank of the Red River of the North, which heads here by the junction of the Otter Tail River and the Bois de Sioux, is pretty, somewhat elevated, very slightly undulating, timber-skirted upon one side, while the other is rolling prairie as far as the eye can reach, presenting, as the setting sun kisses the horizon and sets in its sea of gold, a scene of surpassing beauty. The streets are broad, regularly laid out, and attention has already been given to setting trees and providing other adornments for both streets and residences. The Richland County Bank will become a National Bank in the Spring, and possibly have a competitor in the field; while 1882 will witness the completion to this point of the Northern Pacific, Fergus Falls and Black Hills Railroad, a branch of the Northern Pacific Railroad, diverging at Wadena, running to Wahpeton and thence southwest. The Fargo and Southern Railroad from Fargo to Sioux City, will also pass through the town, and also a western branch of the St. P. M. & M. Railroad, running from here to the Black Hills, giving the place the advantage of being a large railway center, as it will then have no less than eight railroad outlets running to nearly all the chief points of the compass.

The Head-Quarters Hotel, mine host, D. H. Smith, is excellent in all respects, but nevertheless, the rapid growth of the town demands another large, well kept hostlery. A furniture, carpet, wall-paper, and boot and shoe store, are also needed, and all branches of business could be much improved by parties dealing in special lines of goods, and keeping full, well assorted stocks. Industrial pursuits, capital, labor, or suitable light manufacturing, would find both a pleasant and profitable location in this prodigy of Western towns, which promises to become a jobbing mart for points further West.

RICHLAND COUNTY

adjoins Minnesota and is the furthest county south, lying in the famous Red River Valley. It contains over 1,400 square miles, principally the rich, fertile soil characteristic of the valley, but interspersed with streams, and small bodies of water, usually fringed with timber; dotted here and there with good thrifty farms, frame buildings, etc., and along the line of the St. P. M. & M. Railway by small villages which are shipping and trading stations. There are still some lands in the southern and western parts of the county subject to entry under the homestead, pre-emption, and timber-culture acts of the Government. Aside from these, lands can be bought at prices ranging from $4 to $15 per acre, and owing to the diversity previously mentioned, they extend the advantages requisite for varied husbandry. Appreciating this, a number of the farmers in the county are giving increased attention to stock-raising, with good success. The western part of the county is more varied in its surface, and has a number of low, sandy mounds or ridges, while the intervening valleys are very fertile; but to the south, the lands between the Sheyenne and Wild Rice Rivers—perhaps a sixth of the area of the county—are undesirable for cultivation. With this exception, the climate is healthful, crops reliable, markets convenient, schools accessible, society congenial, the present prosperous and the future promising.

The county is rich in resources, abundant in yield, grazing nutritious, range unlimited, water good and abundant, hay of fine quality, cheaply secured, game plentiful, and the settlers contented and prosperous. A good quality of brick clay is abundant, and limestone is found in the southwestern portion of the county.

Richland County was organized only six years ago; in June 1880 the population was 3,300, and now it is estimated at fully 5,000, consisting of both Americans and foreigners, who work harmoniously in promoting all public interests. The bonded indebtedness is $17,000 at 7 per cent., with only a nominal floating debt. The county warrants are at par. In January 1882 the new Court House at Wahpeton, a structure in every way creditable to the county, will be occupied. Wheat, corn, oats, barley, beef, sheep, pork and dairy products are the main sources of wealth in Richland County. Industry, integrity, patience, skill and capital are sure here of a munificient reward. The railway advantages we have alluded to above, and when the roads are completed, this county will have available markets, by rail, lake and river, to all the great commercial centers of the Union.

THE TUBE WELL TROUBLE.

EDITOR RURAL NEW-YORKER:—

I noticed, under the above caption, in the RURAL of Dec. 17, quite an interesting article on the subject of Nelson W. Green's invention (?) which should demand the earnest and universal condemnation of all the farmers of this country. If your space will allow I would like to have you publish, in addition to your former fine article, the facts following:

In the Summer of 1879 suits were commenced in the U. S. Circuit Court of the Northern District of N. Y., by W. D. Andrews, G. H. Andrews and Nelson W. Green, against many persons: among them were some 40 residents of Lansingburgh, N. Y., and one case was selected, viz., Thomas Richardson's as a test case, and Counselors Calvin E. Keach, of Lansingburgh, and C. A. Waldron, of Waterford, commenced the fight in good earnest. Mr. Keach proposed to fight the patent on its merits, as he was convinced no meritorious case had ever yet been fought to a final decision, and he therefore stipulated into the case all the proofs in chief of the complainants and admitted the method of constructing the well as an infringement, thus to speed the case and save complainants' cost, allowing all this to be done without the complainants calling a single witness.

Then came the defense, and on May 6, 1880. Mr. Keach put upon the stand Anson Atwood of Dunellen, N. J. (who now has an office at 57 Astor House, N. Y.,) and in two hours and by propounding only 37 questions, proved that while Mr. Atwood was superintendent of the machinery and agricultural department of the N. Y. State Agricultural Society, and at their annual fair held near Albany, N. Y. in the year 1859 (Green claims he invented this method *after* the war broke out, etc.) a well was constructed on the ground by the same method as now, and as patented. This proof was fully corroborated by the next two witnesses, viz.: James E. Kirwan, of East Albany, N. Y. and Elisha Waters, the renowned paper boat manufacturer, of Lansingburgh, N. Y.

Then commenced the filibustering practice of complainants and the 37 questions put to Atwood by Mr. Keach in two hours, called forth from complainants a cross-examination of over a whole week and more than 700 questions. Then came next Mr. Kirwan, who told his story for defendants in six hours and about 80 questions. This called out proof of the construction of numerous wells by witness at Wauconda and Waukegan, Ill., Janesville and Beloit, Wis., etc. in 1848 and 1849. The complainants still continued their course of pettifogging, and asked Kirwan more than 1,200 questions, keeping him on his cross-examination for 9½ days without shaking his evidence in the least.

This practice was becoming very monotonous as well as expensive to the defendant, and Mr. Keach cited the complainants on motion before Judge Wallace, and on the argument soon convinced the Judge that the intention of the complainants was to *tire out* the defence, and he promptly made an order that the complainants pay to defendant within 10 days the sum of $140, the Examiner's fees for conducting such prolix examinations, and further provided that ever afterwards in the trial the complainants pay the expense of the cross-examination of defendant's witnesses. This proved a "cooler" on them, and they seldom after kept a witness more than one day on cross-examination. This Albany fair ground well was seen by numbers of others, among whom were Alexander Gregory, of Albany; Horace L. Emory, of Cleveland, Ohio; Richard Spicer and John Chapman, of Lansingburgh; Wm. Vergo. of N. Y. City and scores of others. Then next came the witness, Joseph Brott, of 1,051 Fulton Street, Brooklyn, N. Y., who swore to a well put down in front of his father's (Andrew Brott's) hotel, at Waterford, N. Y. about the time his first child was born, which was April 1, 1860. This date was fully established by other witnesses from Waterford, among whom were James P. Vosburgh (since deceased), David T. Lamb, Wm. Hamilton, Wm. H. Fox. E. B. Honsinger, Lewis Wells, and others who saw it put down before they enlisted and went to the war some time about the first of 1861. They also said the man who put it down put one down for Henry Steenburgh at the same time, and since then the heirs of Mr. Steenburgh have found among his old papers a receipt as follows:

$21.50 Received of Henry Steenburgh the sum of twenty-one dollars and a half for driving one well in his place in Waterford. GEORGE MALLER.

Dated April 13, 1860.

[We have now in this office a photograph of this receipt.—EDS.

This was not found until June, 1881, and is fully corroborated by the royalty receipt given by the agents of Wm. D. Andrews & Bro. (Grant & Knight) in 1877, which said the well "was driven in 1860 by one Maller." Both of them will be put in evidence in the case.—To be continued. LEGIS.

Domestic Economy

CONDUCTED BY EMILY MAPLE.

HELPS.

HEAD-WORK will lighten labor; for the housekeeper it will save valuable time and give many an hour for study or recreation.

Beef drippings are better than lard for frying potatoes, mush, etc.

Over-worked people, we think, are not so miserable as those who have nothing to do.

Don't teach an infant to suck its thumb.

Markings or spots of indelible ink can generally be removed by washing the place first with a solution of salt and afterward with ammonia water.

A bit of black court-plaster is a very good thing to mend a small tear in black silk or any kind of black goods. Moisten the plaster, put underneath the tear, sticky side up, and press the frayed edges of the goods down upon it.

ECHOES FROM EVERY-DAY HOUSE.

ANNIE L. JACK.

ONE of the pleasures attending the holiday season is the pleasure of giving. The time occupied in providing little gifts for those we think will appreciate them, and the labor attending such work, anticipating the results, give the donor a feeling of exaltation that proves the truth of the Scriptural verse, "It is more blessed to give than to receive." It is a good thing to teach children to share with their poorer neighbors, to allow them to purchase material and make up small articles of usefulness for others, and thus they learn the blessedness spoken of.

The wheels of the household machinery jog steadily on without meeting many "stumbling-blocks" during the long Winter. Unlike the Summer, when work crowds, one feels a leisure that no other season brings. Then the sewing of the future begins to take shape with hands and brain, and we find time to read the perhaps uncut magazines, and are glad that Winter comes with its rest and quiet.

What funny things one finds out by little experiments even at the kitchen fire. I was cooking some onions the other day, and at the same time scalding vinegar to put over some pickles. The smell of the cooked onions is very objectionable to one member of the family, and we were quite astonished to find the vinegar had absorbed all the odor. I afterward saw the same thing in a Western paper, and realized that "there is nothing new under the sun."

Speaking of giving, reminds me that I went into the house of a fashionable lady in the city lately and found in her dining-room a table set out with molds, and bowls of jelly. During conversation I found it was for the sick of her neighborhood, prepared by her own hands, to be sent not only to rich acquaintances, but to the poor as well, with a few choice flowers. I asked for and received the recipe which was so simple and resulted in such a pretty and tempting dish that I transcribe it here, for the dish is pleasant to take to those who are well, whatever it may be to the sick:

Two pounds of sugar; one pint of sherry; one pint cold water; one package Coxe's gelatine; juice of two lemons; one quart of boiling water; a trifle of cinnamon. Soak the gelatine two hours, add sugar, lemons and flavoring. Pour over all a quart of boiling water and stir thoroughly. When the gelatine is dissolved put in the wine. Strain through a double flannel bag without squeezing, and wet your molds with cold water, and set the jelly away to cool after filling the molds about three parts full.

FELON CURE.

M. B. MCLOUTH.

A SENSIBLE cure for a felon is a small plaster as large as the finger nail, spread with the salve used for fly blisters. Keep it on 12 hours, then where the finger is puffed up, prick with a *needle* and let out the water. (Never use a pin to open a sore, for often very serious consequences ensue, as brass is very poisonous.) There is nothing painful about the process, but the finger will be *very* tender. The skin that is separated by the blister keep on just as long as possible, or until it comes off itself. The flesh underneath will be exceedingly sensitive, and will need washing with cream oil or sweet oil.

To Make Cream Oil.

Put a cup with a spoonful of sweet cream on the stove-hearth and let stand, without stirring, until a clear oil rises. Of course, the sooner applied after the felon begins to prickle, the more certain the cure.

The Best Known Recipe for Corning Beef.

Cut the beef in small pieces, leaving out the large bones, pack solid in a six-gallon crock with a weight on top. Pour over the beef boiling-hot brine made as follows: Two gallons of water, three pounds of salt, one ounce of salt-peter, a pound of sugar and two large spoonfuls of baking soda. After two weeks, heat and skim the brine, and repeat the process whenever you think necessary, but never put the brine on hot after the first time. If the weather is hot you can add a handful of salt and soda at any time, and like all pickling be sure the brine covers the beef. If packed in a barrel, a large cloth should be securely tied over it in Summer, to secure its contents from flies. The nicest vessel to put it into is a half-barrel earthern jar.

Pillow Shams.

Make of the size required out of book-muslin (plain or dotted), or organdy. Line the shams with Turkey-red. Make a ruffle five inch deep of the muslin, hem on each side and finish with a very narrow valenciennes edge. Gather, leaving a heading an inch deep, and stitch to the sham. The muslin should be a little larger in every way than the Turkey-red lining, so that the muslin can be turned under and hemmed down on the lining.

MARY B.

Excellent Apple-sauce.

Pare, half and quarter nice stewing apples, put into a baking dish, strew thickly with sugar, and add a little nutmeg or lemon peel. Cover the dish with a plate, set into a pan having an inch or so of hot water in the bottom and place in a hot oven. Bake until the pieces are clear and tender. This sauce when eaten with a little sweet cream makes a very good dessert. Plain cake in this case may be served with it. C. G.

QUESTIONS ANSWERED.

That Black Tea-kettle.

Mrs. McL. writes that she is very much annoyed with a black tea kettle, and notwithstanding she has used sand, ashes and kerosene upon it, she can not make it look well.

ANS.—We can sympathize with Mrs. McL. because we once owned such a kettle. We at last blackened and polished it with stove-blacking which answered after a fashion, but when in careless hands the lid was broken off we were glad to replace the objectionable kettle with one less offending to the eye.

The Milwaukee (Wis.) Evening Wisconsin says: "In all our experience we have never heard so many favorable reports from all classes as we have concerning St. Jacobs Oil."—*Com.*

A Healthy State.

People are constantly changing their homes from East to West and from North to South or *vice versa*, in search of a healthy State. If they should learn to be contented, and to use the celebrated Kidney-Wort when sick they would be much better off.—Translated from the New Yorker Zeitung.—*Adv.*

BURNETT'S COCOAINE

Has Received Universa Endorsement.

No other preparation possesses such remarkable properties for embellishing and strengthening the hair and rendering it dark and glossy. It cures baldness and eradicates dandruff.

BURNETT'S FLAVORING EXTRACTS are the best.

The ladies who sometime since were unable to go out, having taken Lydia E. Pinkhams Vegetable Compound, are quite recovered, and have gone on their way rejoicing.

"Wonderful, Wonderful Medicine!"

So exclaims a patient, Rev. J. S. Fesperman, of Statesville, North Carolina. Writing June 2d, 1880, he says: "In the providence of God I owe my present state of health to your Oxygen. I was near the gate of the grave, and, as I believe, close to the great portals of eternal life, when I commenced taking what I now consider the greatest of all healing agents, Compound Oxygen. I cannot refrain from saying, *'Wonderful, wonderful, wonderful medicine!'* Physician and friends had believed that I could not live any length of time, and I am here yet, with my large family of children, and able to walk three to four miles every morning. I cannot speak in terms too high of your remedy." Our Treatise on Compound Ovygen, containing large reports of cases and full information *sent free.* Drs. STARKEY & PALEN, 1109 and 1111 Girard St., Philadelphia. Pa.—*Adv.*

The Markets.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Dec. 24, 1881.

BEANS AND PEAS.—A good steady trade attends the bean market, and prices are well supported, though extra marrows are a trifle off from the early part of the week. German stock has sold liberally to go West. Red kidneys are in good, though not large, demand. Green peas sell fairly at quotations. Black-eyed peas quiet but firm for choice.

Beans marrow, prime, $3.70@3.75; fair to good, $3.25@3.45; medium, choice, $3.20@3.25; fair to good, $3@3.15; pea, choice, $3.25@3.30; fair to good, $2.90@3.05; white kidney, choice, $3.45@3.50; fair to good, $3.20@3.35; red kidney, choice, $2.85; fair to good, $2.50@2.80; turtle soup, $1.75@1.80; German in bags, $2.50@3.00. California Lima, $4.50@4.75.

Peas, green, prime, in bbls., $1.55@1.60; green, in bags, $1.40@1.50; Southern b. e., per 2-bu. bag, $2.25@3.40. Canadian peas in bond, 95c.

Receipts of beans for the week, 6,816 bush.

Exports do. 311 bbls.

BUTTER.—There is no marked activity in any grade. Sellers, however, do not look for a free business at this part of the year, and besides the weather is soft and unfavorable for the exhibition of many lines of stock. There are some coastwise orders for nice yellow firkins, but not to be filled at full prices. State butter as a rule is quoted at last rates, and extra Western creamery is not up to the points noted last week. Western butter is about as active as any style and nice imitation creamery sells as readily as fine half tubs of State. Rolls hold a line of trade, though their old popularity is diminishing yearly, especially since the introduction of so many substitutes for butter, as dishonest dealers are allowed an extra chance of swindling under cover of muslin.

Creamery, fancy, 42@43c.; choice, 40c.; fair to good 36@38c.; ordinary, 28@33c.; State half-firkins, tubs, fancy, fresh, 34@35c.; choice, 32@33c.; prime, 25@30c.; fair to good, 22@24c.; firkins, choice, 30@31c.; fair to good, 26@28; ordinary, 20@23c.; dairies, entire choice, 30@32c.; fair to good, 26@30c.; State Welsh tubs choice 32@33c.; fair to good, 25@31c.; Western imitation creamery, 28@30c.; dairy choice, 30@32c.; good to prime 25@30c.; ord nary to fair 18@24c.; Western factory, special marks, June 16@17c; general run do. 13@15c.; choice, current make, 25@28c.; fair to good do. 15@18c.; common butter, 12@14c.; roll butter, fine, 25@27c.; ordinary, 20@24c.

Receipts for the week, 21,075 pkgs.

Exports do. 578 do.

COTTON.—The wide difference of opinion as to the possible crop has checked earnest movement, and it would seem as if large operators are not inclined to enter the market with vigor until the Interior movement of stock affords a clearer impression as to the quantity.

CURRENT PRICES FOR SPOT COTTON.

Quotations based on American standard of classification and on cotton in store, running in quality not more than half a grade above or below the grade quoted.

EGGS.—Receipts are moderate, and as strictly fresh lots are pretty well used up the market is firm for them. Stored and held lots are only steady. Limed hold their former good place.

Near points, ₱ doz. 23@25c.; State and Pa. 31@32c.; Western, choice, fresh laid, 28@30c.; do. and Canadian fine, held, 26@26½c.; Southern, fresh fine, 28@30c.; Western, Southern and Canadian, fair to good, 24@26c.; limed eggs, State, 23@24c.; Canada and Western, prime, 23½@24½c.; fair to good, 21@22c.

FLOUR.—The week has been dull and tame, with more sellers than buyers, and prices for upper and lower grades are in buyers' favor.

No. 2, per bbl., $3.40@4.35; State and Western, superfine, $4.40@4.50; city mills, XX, $6.90@7.35; Spring wheat, extra, $5.00@5.35; Spring XX and XXX, $5.50@6.75; patents, $5.50@8.50; Ohio round hoop shipping, $5.25@5.65; trade brands, $5.75@5.90; St. Louis extra, $5.40@5.90; do. double extra, $6.10@6.50; do. family, $6.65@7.25; Southern extra shipping, $6.60@6.40; do. XX and family, $6.50@7.50. Rye flour, superfine, $4.70@5.00; buckwheat flour ₱ 100 ℔s, $3.50@3.90. Cornmeal, Brandywine ₱ bbl, $3.75@3.85; do. Western, $3.35@3.75. Wheat feed, ₱ ton, $19.00@23.00.

Receipts of flour for the week, 109,174 bbls.; corn meal, 3,900 do.

Exports of flour for the week, 44,050 bbls.; corn-meal 5,671 do.

FRESH FRUITS.—The market is quite as active as is usual preceding Christmas. The demand is greatly divided up at that time as there is so much use for foreign items. Apples have sunk badly in quality this open month. Many dealers now have to repack to fill a fine order; cranberries active. Peanuts are higher. Lady apples scarce and high, but they sell quickly. Florida oranges active, the trade is in more hands than usual and prices are a little irregular.

Apples, Spitzenberg, ₱ bbl. $3.50@4.50; Greening, $3.50@3.75; Baldwin, do. $3.00@3.50; mixed lots, good to prime, $2.75@3.25; ordinary $1.75@2.00. Lady apples, choice, ₱ kg, $5.00@7.00. Pears, choice varieties, ₱ box, $2@3.50. Cranberries, Cape Cod, choice $12.50@13.00; good ₱ bbl, $10.00@12.00; poor to fair $6.00@8.00; Jersey fancy, ₱ crate, $3.25@3.50; prime, $2.50@3.00; fair to good $2.00@2.25; Florida oranges, half-bbl. case, $2@2.50; do. ½ bbl. case, $1.50@2.75.

Peanuts, Va, hand-picked, ₱ ℔, 7¼@8c.; f'y, 7¼@7½c; extra prime, 6¾@7c.; good to prime, 6¼@6½c.; shelled, 4@6c.; pecan nuts, 10@12c.; hickory, nuts, State, ₱ bush. $1; Western, 75c@$1.

GRAIN.—Prices for wheat have dropped to a point on which many orders were based, and the result shows an active week for export. Corn has been fairly dealt in; the drift of prices, however, is easier. Oats fairly active.

Wheat, Spring, $1.30@1.36; Spring No. 2, $1.26@1.28; red Winter No. 2, $1.30@1.40; red Winter, $1.30@1.40; white Western and State, $1.30@1.40. Rye, 95@96c. Oats, white No. 1, 51@51½c.; No. 2, 49½c.; No. 3, 49c.; mixed, No. 1, 48½@49c.; No. 2, 48½@48¾c.; No. 3, 45@46c. Corn, Western, mixed, 65@70½c.; do. No. 2, 66@66c. yellow, 68@70c.; white, 70@75c. Barley, Canada, No. 1, $1.10; do., "bright," $1.13@1.15; State, 4-rowed, 97c.@$1; 2-rowed, 83@85c. Buckwheat, $1@1.02. Barley malt, State 2-rowed, 95c@$1; do. 4-rowed, $1.07@1.10; Canada, $1.20@1.25.

The visible supply of grain, comprising the stocks in granary at the principal points of accumulation at lake and Atlantic ports, and on rail, on lakes, on canal and on Mississippi River:

	1881, Dec. 17, bush.	1880, Dec. 18, bush.	1879, Dec. 30, bush.
Wheat	18,703,725	29,709,283	27,857,589
Corn	18,390,914	16,365,285	9,317,730
Oats	2,719,047	3,783,061	2,672,165

Rye	1,237,041	940,916	1,127,831

Receipts for the week, wheat 2 6,882 bush.; corn, 265,200 do.; oats, 110,800 do.; rye, 29,882 do.; malt, 31,761 do.; barley, 46,770 do.

Exports for the week, wheat, 706,000 bush. corn, 237,745 do.; oats, 2,418 do

HAY AND STRAW.—The market for hay has stiffened some, but sales are not large, as buyers took good sized parcels during the late easy rule of prices. Straw steady and firm.

Hay, rel all quality, fine, ₱ 100 ℔s., 95c.@$1.05; do., fair to good, 80@90c.; shipping quality, 60@70c.; clover mixed, 70@80c.; all clover, 70@85c.; Straw, best, 70@80c.; short rye, 55@60c.; oat, 40@50c.

HOPS.—Brewers seem to be in want of supplies, but do not bid up to the views of sellers, and an export call is also in view. Country market reported firm.

New York State crop of 1881, prime to choice, 26@30c.; do., mediums, 23@25c.; do., low grades, 20@22c.; do., 1880, good prime, 186@22c.; do., low to fair, 12@15c.; do., 1879, fair to choice, 16@20c.; do., olds, 7@15c.; Eastern, crop of 1881, fair to choice, 21@26c.; Wisconsin do., 20@27c

Receipts for week ending Dec. 23d, inclusive, 1,618 bales; since Sept. 1st, 50,285 bales. Exports for week ending Dec. 22d, inclusive, 280 bales; since Sept. 1st, 15,509 bales.

MILK.—The average for the week was $2.10½, opening at $1.75 and closing at $2.50 ₱ can of 10 qts. Market lively and all commission lots have sold out clean.

POULTRY AND GAME.—Near point shippers of dressed have held back stock late and at the close are doing well in prices for Christmas. A good deal of cheap stock is here owing to the mild weather, but it will likely go out, as the holiday embraces two days to be provided for.

Turkeys, Phila., 15@16c.; Bucks Co., prime, 15@16c.; Jersey, prime, 15@16c; State and Western, prime, 14@15c.; poor to good, 12@13c. Chickens, Phila., 13@15c.; Bucks Co., prime, 12@13c.; Jersey, prime, 12c.; State and Western, prime, 10c.; poor to good, 7@9c. Fowls, Philadelphia, 10@12c.; Bucks Co., prime, 10@11c.; Jersey, prime, 10@11c.; State, Western and prime, 8@9c.; poor to good, 6@8c.; Phila., prime, 14@15c; Jersey and Bucks Co., prime, 13@15c. Ducks, State and Western, prime, 13@14c.; poor to good, 10@12c.; Phila. dry picked, 12@14c.; Geese, Jersey and Bucks Co., prime, 11@12c.; State and Western, prime, 11@12c.; poor to good, 9@10c.

Live poultry is hardly asked for, with the exception of a few turkeys that are good enough to be dressed for imitation wild.

Spring chickens, large Jersey, 8@9c., do., light, 8c.; Western, ₱ ℔, 7@8c. Fowls, Pa. and Jersey, ₱ ℔, 8c.; State, 8c.; Western, ₱ ℔, 7@8c. Roosters, old, ₱ ℔, 4@5c. Turkeys, Jersey and Pa. ₱ ℔, 11@12c.; Western, 10@11c. Ducks State, Pa. and Jersey, ₱ pair, 50@70c.; Western, ₱ pair, 40@50c. Geese, Western, ₱ pair, 80c@$1. State, Pa. and Jersey, ₱ pair, $1.25@1.50.

The approaching holidays give a good deal of snap to trade, and all fine stock is soon absorbed. Sellers dare not ask the sharp rates they might if the weather was cold, still fair compensating prices are ruling.

Quail, choice, ₱ doz. $2.25@2.50; small and soft do. $1.50@2; prime undrawn, ₱ pair, $1@1.12; grouse, prime undrawn, ₱ pair $1.00@1.25; drawn, 80@90c.; partridges, State and choice Western, ₱ pair, $1.00; Eastern and ordinary Western, 50@75c.; wild ducks, canvas-back, ₱ pair, $2.75@3.25; red-head, 50c@$; mallards 40@50c.; teal and wood, 30@40c.; common, 25c.; tame squabs, light ₱ doz. $2.50; dark, $1.25@1.50; tame pigeons, live, ₱ pair 25@30c; venison, Minn short saddles, ₱ ℔. 15c.; other Western and State 13@15c.; whole deer, 10@12c.; rabbits, ₱ pair, 30@40c.; hares, 35@40c.

PROVISIONS.—The week has been in the aggregate a satisfactory one. Large blocks of refined lard have been taken and dealings have been liberal in Western steam. The movement in bacon has been the largest of the season chiefly on continental account outside of France. At the close shippers are out of market and prices have naturally eased off.

Pork, West. mess, old, ₱ bbl, $16.50@17.00; do. new, $17.50@18; prime mess, $16@16.50; extra prime, $13.50. Lard, steam Western, ₱ 100 ℔s., $11.10@11.15; pr city, $11.00@11.05. Hams, smoked city, ₱ ℔, 11@12c.; pickled Western and city 9¾@10c. Shoulders, smoked city, 8@8¼c; pickled, 7@7½c. Rib bellies, pickled, 8¾@9¼c. Bacon long clear Western, 9@9¼c. Beef, W'n mess, ₱ bbl. $11.50@12.50; packet, $14.50@15.00; India mess, ₱ tce. $25@26.50. Beef hams, ₱ bbl. $21@21.50.

Receipts for the week — Beef, bbls. and tcs. 1,124, pork, bbls 7,500; cut-meats pkgs 41,713; lard, do. 15,500

Exports for the week—Beef, bbls. and tcs. 3,000; pork ℔s. 5,000; cut-meats, ℔s. 9,866,187; lard do. 6,797,700.

VEGETABLES.—Potatoes are firm, with no oppressive receipts.

Potatoes—Early Rose. N. S., ₱ d.-h. bbl., $3@3.25; bulk, ₱ bbl. $2.75@3; State, ₱ d-h bbl $2.87@3.12; bulk, per bbl, $2.75@3.00; Prolific, N. S. per d.-h. bbl, $2.75@2.87; bulk ₱ bbl. $2.50@2.75; Snowflake, State, ₱ d.-h. bbl. $2.75@3.00; bulk, ₱ bbl. $2 62@@2.87; Burbank, ₱ d.-h.bbl. $3@3.12; bulk, ₱ bbl. $2.87@3.00; Peerless, bulk, ₱ bbl., $2.50@2.75; Mercer P. E. Island, ₱ bbl. $1.50@2.25; sweet potatoes, Va. yellow, ₱ bbl. $3.75@4; Del. River, $4.50@4.75; Jersey, ₱ bbl. $3.50@4.00; inferior, $2.50@3.25.

Garden truck is firm for prime lots.

Onions, white, ₱ bbl. $2.50@3.50; yellow, $2.00@2.12. red, Eastern, $2.00; Chester red, $1.75 beets, L. I., $2.25; cabbage, L. I., ₱ 100, $10.00@18.00; cauliflower, Jersey and L. I., ₱ bbl., $1.00@7.00; white turnips, $1.25@1.50; Russia do., $1.50@1.75; squash, L. I., $2.50@3.00; do., State Hubbard, $1.75@2.00; carrots, $1.25 ₱ bbl.; celery, ₱ doz. bunches, $1.00@2.00.

WOOL.—The indications are that stocks will show lighter than was expected by the first of the new year, and strong prices are anticipated by the trade.

LIVE STOCK MARKETS.

NEW YORK, Saturday, Dec. 24, 1881.

BEEVES.—Receipts for the week, 11,529 head: do. last week, 12,340 do. The demand from all sources was moderate, but in view of the light arrivals to-day and prospects of small receipts on Monday, drovers endeavored to crowd prices up. A few early sales were undoubtedly above the low figures at the close on Wednesday, but early prices could not be sustained, and much of the business was at lower prices than the average on Wednesday. A pretty good clearance was made, but the warm, muggy weather had a depressing influence, which was only partially offset by the predictions of colder weather to-morrow. A number of car-loads of light native cattle sold at 8½@12½c. to dress 55 ℔; medium to fair do at 9¼@10c. to dress 55@56 ℔s; good to prime do at 10¾@11¾c. A car-load of Illinois steers sold to Mr. Adolf Edlemuth at 12c to dress 56@60 ℔, and the New York Provision Co. paid 13@13¼c. to dress 69@70 ℔s. for a few selected cattle. In answer to inquiry we would state that exports as a rule take the very best cattle.

MILCH COWS.—Market slow at last decline. The quotable range is $35@75 ₱ head for poor to best. Sales have been chiefly at $45@65.

SHEEP AND LAMBS.—Receipts for the week, 25,671 head; do. last week, 28,875 do. There was no demand of any consequence at the close, and hardly eight carloads of stock had changed hands up to 12 m. A car-load of choice Ohio sheep sold at $6.45; a load of poor culls at 3c. ₱ ℔ and four cars of Ohio and Kentucky sheep at 5¾@5¾c. And a load of Canada lambs & Western ewes mixed sold at 5¾c., and $5 on the lot.

SWINE.—Receipts for the week, 32,116 head; do. last week, 29,206 do. Market dull for live and prices are weak. Good demand for useful light dressed country.

Hogs, New Jersey dressed, light, 8¼@8¾c.; medium, 8@8¼c.; heavy, 7½@7¾c.; city dressed, 7½@8c.; live hogs, corn-fed, ₱ 100 ℔s, $6.10@6.30; pork tenderloins, ₱ ℔, 5@10c.

VEAL CALVES.—The demand is good for prime calves; trade is not as brisk as it would be if the weather were more seasonable.

City-dressed, choice, 12@12½c.; dressed, fair to good, 10@11½c; do., grass, 5@6c; live calves, N. J. prime to choice, 9@9½c.; do, State, 8¾@c.; fair to good, 7½@8¼c.; poor to fair, 6@7½c.; Mount Hollys, 160 to 220 ℔s 9@10c.; 221 to 280 ℔s 8@9c.; 281 to 400 ℔s 6@8c.; live calves grass, 3@3½c

VIRGINIA CO-OPERATIVE STOCK FARM and POULTRY YARDS.

Registered Jersey Cattle of best butter strains a specialty. The largest herd in the State, kept on three farms, and most successful at Virginia State Fairs. Young stock for sale. Also Cotswold, Shropshire and South Down Sheep. Berkshire, Essex and Jersey Red Swine, and all the leading varieties of pure-bred Poultry. Address A. P. ur M. B. ROWE, Lock Box 31, Fredericksburg, Va.

WATCH BUYERS, ATTENTION!

THE CELEBRATED

BOREL & COURVOISIER WATCHES

were awarded a gold medal at the Paris Exposition in '78, for greatest accuracy in performance and adjustment. These watches have all modern improvements in watch making, being stem-winders adjusted to heat and cold and for R. R. use. By reason of improved machinery they are manufactured at a great reduction from former prices. All are warranted. *"No time, no money."* Ask your jeweler and see them before purchasing those of other manufacturers.

A Bargain!

THE

OHIO FARMER

AND THE

RURAL NEW-YORKER.

BOTH PAPERS ONE YEAR

FOR ONLY THREE DOLLARS!

THE OHIO FARMER, published at Cleveland, Ohio, is one of the oldest and very best Agricultural and Family Journals of America. It has been established thirty-five years, is a 16-page, 61 column weekly, with frequent 16-column supplements, giving to its readers nearly 900 columns of the most valuable, reliable, interesting and instructive matter in a year, at only

$1.50 PER YEAR, POSTAGE PAID.

THE OHIO FARMER is a thoroughly practical Agricultural Journal, containing each issue about one hundred articles written expressly for it by actual, practical, successful Farmers, Horticulturists, Thoroughbred Stock Breeders, etc. It aims to give actual instruction from reliable sources, that any farmer can understand and put into practice. It is

Acknowledged Authority on all Agricultural Topics,

and is conducted by an able and experienced Editorial Management, who spare no expense or labor to add everything possible to its value.

THE OHIO FARMER has now a paid list of **over 35,000** subscribers, which is unquestionable evidence of its value to the intelligent farmers of the country.

THE RURAL NEW-YORKER, with Free Seed Distribution, and THE OHIO FARMER will both be sent one year for **only $3.00**, which is only about the price either one ought to be offered at. This is a bargain to any farmer who wants the BEST agricultural papers of this country.

For Specimen Copies and Premium Lists of THE OHIO FARMER, free, address

THE OHIO FARMER, Cleveland, Ohio.

CHEAP FARMS

AND NEAR TO MARKET.

The State of Michigan has a good climate, a fertile soil, four thousand miles of railway, and sixteen hundred miles of lake transportion, convenient markets, a settled society, established institutions, great and diversified industries, a liberal free school system, low taxes and practically no debt. It has also several millions of acres of unoccupied lands, suitable for almost every variety of husbandry, many of them subject to free settlement under United States or State Homestead laws, and all of them for sale at prices within the reach of men of small means.

A PAMPHLET, *issued under authority of the State*, containing a map of Michigan, sketches of its Industries, Agricultural Productions, and Institutions, and descriptions of its Soil, Climate, Timber, the situation of its Unoccupied Lands, etc., will be sent *free of charge* on application by letter addressed to the COMMISSIONER OF IMMIGRATION, DETROIT, MICHIGAN.

SOUTH Don't locate before seeing our James River Settlement. *Illustrated Catalogue free.* J. F. MANCHA, Claremont, Surry Co., Va.

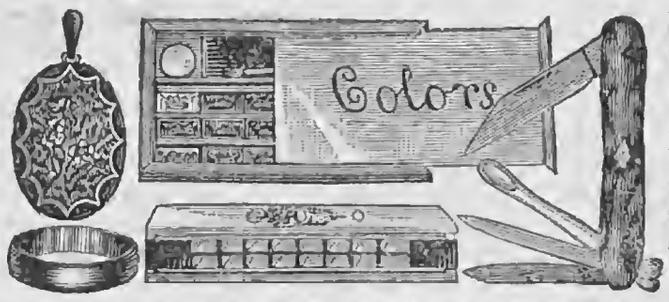
Stock or Dairy Farm Wanted.

Parties having a good Stock or Dairy Farm for sale containing not less than three hundred and from that to one thousand acres, within easy reach of Railroad, can find a purchaser (if they can fill the bill) by writing the undersigned, giving very full particulars and price.

R. W. E.,
Yale Box 50, Olean, N. Y.

An Honest Advertisement!!—An Unparalleled Offer!!

A Splendid Story Paper, and a Valuable Agricultural Paper, Both One Year for One Dollar, and Six Useful Premiums Free! We publish two of the largest, handsomest and best family papers in the United States—papers widely known and universally admired. The first is **The Cricket on the Hearth,** a large and handsome 16-page, 64-column *illustrated* paper, filled with the finest serial and short stories, sketches, poems, useful knowledge, wit and humor, games, puzzles, etc. The second is **Cottage and Farm,** a valuable 8-page, 32-column *illustrated* paper, devoted to Agriculture, Horticulture, household notes and recipes, ladies' fancy work, stories, poems, news, etc. The regular price of the former is $1.00 per year, and of the latter 50 cents, and they are positively the best home and family papers published for the price. Notwithstanding the already large circulation of these popular periodicals, we are ambitious to still further enhance their popularity. We wish to obtain for them, immediately, 100,000 new subscribers; hence we make the following grand extraordinary offer—*the greatest and most liberal ever made by a reliable publishing house!* *Read this: Upon receipt of only* **One Dollar** *we will send* **The Cricket on the Hearth** *and* **Cottage and Farm** *both for* **One Year,** *and to every subscriber we will send,* **Free** *and postpaid,* **Six Valuable and Useful Premiums,** as follows: No. 1.—**Imitation Tortoise Shell Pen-Knife, Tooth-Pick, and Ear Spoon.** This most useful and valuable article is a pen-knife of fine steel, with handle of handsome imitation tortoise-shell; with the knife is also combined two tooth-picks and an ear-spoon. No. 2.—**Box of Paints or Water Colors.** Here is something that will cause all the little folks in the family to fairly dance with delight. The box consists of eighteen colors, with brush and cups. No. 3.—**Lady's Malachite Locket.** These beautiful Lockets are imported from Europe, where they are extremely popular. The face is beautifully enameled, and composed of many colors, harmoniously blended. At the back is a space to contain a portrait. No. 4.—**Ladies' or Gentlemen's Plain Gold-Plated Ring.** This ring is of a good quality of gold plate, and will therefore wear well and give excellent satisfaction. It is a plain gold-plated ring, suitable for either lady or gentleman. No. 5.—**Imported German Harmonica,** 16 holes. The harmonica is a musical instrument very easily learned—almost any child can play upon it with a few hours' practice. No. 6.—**"The Most Laughable Thing on Earth."** This is one of the merriest household games ever invented. It provokes roars of laughter wherever played. Remember, we send, packed in a box, *all* the above named premiums to every one who sends one dollar for a year's subscription to THE CRICKET ON THE HEARTH and COTTAGE AND FARM. In addition to this, we shall place in one premium box in every 25 a Special Grand Prize of a *Solid Gold Parisian Diamond Ring;* in one box in every 10 a Special Grand Prize of a *Pair of Parisian Diamond Ear Drops,* rolled gold settings; and in one box in every 5 a Special Grand Prize of a *Parisian Diamond Stud,* rolled gold setting. Every subscriber receives the two papers one year and six premiums for one dollar, and 34 subscribers out of every 100 will receive one of the Special Grand Prizes. This is the greatest and most liberal offer ever made by a reliable publishing house, and is a rare opportunity to secure an immense amount of good reading and a large collection of splendid premiums for a very little money. Our premiums are all warranted first-class, genuine and valuable articles. We make this great offer to introduce our papers into new homes; the subscribers we obtain this year we hope to retain for many years to come; hence we cannot afford to treat you unfairly. *Perfect satisfaction guaranteed or money refunded.* We refer, as to our reliability, to any newspaper published in New York, as we are well-known. Send at once and get this extraordinary bargain. If you will show this advertisement and get up a club of five, we will send you the two papers for one year and the premiums free! Address, **S. H. MOORE, Publisher, No. 3 Park Place, New York.**



For the Young.

DAISY'S YEAR IN SOUTHERN CALIFORNIA.

ALICE P. ADAMS.

Up the Coast.

SAN GABRIEL, Cal., Nov., 15, 1881.

MY DEAR MOTHER:—I closed my last letter as I was about to describe San Buenaventura, or Ventura, as it is usually called. It is a very commonplace little town. I did not like it at all. We walked all through it—which did not take long. They have a Mission church which is more modern-looking than the one at San Gabriel (though of course there is no comparison between them) and has eight bells. The doors were locked so we did not go inside. There was one pretty place there; it had a beautiful lawn, and a good many Monterey cypress trees trimmed in fanciful shapes—one was in the form of an old arm chair, and the gentleman, who saw us looking at it over the fence, invited us to come in and try it, which we did, and found it quite comfortable.

Violet was so provoked at some of the people at the hotel who had never been in Los Angeles, and asked all manner of questions about it, and thought it must be very unpleasant to live in such a hot place. "They act as if we came from the torrid zone!" she cried. "I'm sure I'd a good deal rather live right on the equator than in this stupid old town!"

"Oh tranquilize your ruffled spirits I beg of you," said Bert in his tantalizing way, "and reflect on all the bliss these misguided people have foregone by refusing to go one hundred miles further south." But Violet will never be able to see any good in Ventura.

We girls got up early the next morning and went down to the beach right after breakfast, while Mr. Erman was attending to his business. A schooner was anchored at some distance from the wharf, and as we looked through the field-glass we could see the men on board bustling around. They let down a small boat which a man rowed back and forth from the wharf to the schooner, apparently without accomplishing anything. We saw such strange sea-birds flying and swimming about; the head and bill looked as long as the body. I think they must have been pelicans, for with the glass I could see they had a large pouch under the bill which they occasionally swelled out after diving. When they were swimming they looked very much like swans. There were a great many smaller birds flying about with them, and we could hear their shrill cries above the roar of the breakers.

We did not start till late on account of the tide, as the drive from Ventura to Santa Barbara is on the beach the greater part of the way, and there are two points where it is covered with water at high tide. I enjoyed the drive very much. The tide was going out and left the beach so smooth. I love to watch the breakers. It seems as if I could sit and look at them for hours. The horses were very much frightened at first, but sobered down when they found that the great noise did not hurt them, and the water barely wet their hoofs. Bert was determined to make his pony go in the water, and master Jim was equally determined not to go; so they had quite a struggle. Jim slipped on the wet sand, and Bert narrowly escaped a ducking in the great Pacific ocean.

About ten or twelve miles from Santa Barbara is a pretty little valley called Carpenteria, and we stopped here for a short time at a Mr. Cadwell's with whom Mr. Erman was acquainted. He has a large fruit ranch, and we found him engaged in packing specimens to send to the Los Angeles fair. He kindly took us through his orchards, however, and such luscious fruit as he gave us! His is an old place, and he has a great many varieties of seedling apples and pears that he raised himself.

Mr. Cadwell does not irrigate any, neither does he trim his trees—nearly all of them had branches loaded with fruit lying right on the ground. He lets them grow in this way for a windbreak, but it looked odd after being accustomed to the San Gabriel orchards which are all trimmed up high.

Here we saw the moss draped oaks again, but I don't think they were as pretty as at Newbury Park I think the people of Santa Barbara and Carpenteria ought to "know beans" if they improve their opportunities for observation. There are fields and fields of beans, and the same might be said of flax. These two—flax and beans—appear to be the principal crops raised in this vicinity.

We reached Santa Barbara safely, though I cannot tell you one word about it now, for my letter is already very long. But I know you will read it through because it is from

Your loving daughter, DAISY.

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK.—I will write once more as I did not see my last letter in print. I would like to join the Club. The pink seeds you sent my father were perfectly beautiful, and were in blossom all through October. Will they live out over the Winter. (Yes.—U. M.) I have a pair of silver duckwing game bantams which are very handsome, and a pretty little seabright rooster; he weighs just one pound and he feels very smart.

New Haven, Conn. EDDIE C. JONES.

UNCLE MARK:—I desire to become a member of the Horticultural Club, and will do my "level best" with all seeds that you may send me. I wonder that you do not tire of being praised so much; but, I, too, must add my mite, and say that pa takes your paper and we think it is excellent, and that it certainly has a big kind heart, or it would never make such liberal distributions of seeds, often no doubt to fall into careless or inexperienced hands. We have discovered springs in this county that, rumor says, possess rare medicinal properties—the Blanchard and Britt Springs. Arkansas may yet become famous for her health-giving waters. I hope you will allow me to take my place with the "cousins," and subscribe myself as Your niece,

Hillsboro, Ark. LUCY W. STEVENSON.

New Members of the Club for Week Ending Dec. 24th.

Mary Ball, Martin Ball, Annie Taylor, Arba J. Marsh, Charles Demotte, Addison Reynolds, T. G. Towner, Jennie Pherrin, Maggie Piche, Mollie Weed, Emma Janney, Ella Finney, Harry Finney, Teresa Hogan, Mamie Silter, Guy C. Barnard, Gertie Chapman, Lizzie Kelley, Margie Kelley, Ruby Leete, May Lynes, Jennie Spaulding, Harley Matthews, Ella Matthews, Earl Matthews, Homer Bull, Rose Loomis, Frank Loomis, Willis Perkins, Arthur Haines.

The Querist.

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention.]

COTTON-SEED MEAL, ETC.

H. A. M., Ocala, Fla., referring to our remarks on "new-process" oil meal in the RURAL of Dec. 3, asks, 1, how the cotton is separated from the seed; what proportion of acid or other chemical is used; how is the oil separated from the cake; is there any patent on the process; 2, what hedge plant would spread and turn cattle and hogs.

ANS.—1. The cotton (we suppose you mean the adhering lint after the cotton has been ginned) is removed with the hulls and separated by a small machine called a cotton seed huller. The kernels, coarsely broken, are screened from the hulls and lint. They are then finely ground into meal, and the meal is pressed between hot iron plates. Cotton seed is not treated by the new process, but linseed is. This consists of the use of benzine and other substances to dissolve out the oil of the seed, and the oil is separated from the spirit by distillation. There are different processes, but all are patented. Copies of the specifications can be procured from the Patent Office at Washington for one dollar each. These will give the whole process in detail. 2. Osage Orange, Honey Locust, Japan Quince. A barbed-wire hedge won't spread, but it will turn cattle and hogs.

BLACK TEETH IN PIGS, ETC.

C. E. DeG., Egan, D. T., having seen it stated that the Victoria Grape, one of the seedlings of the late T. B. Miner, is hardy, asks whether we could furnish him with a dozen cuttings for the purpose of testing the grape there; 2, whether "black teeth in pigs" will prevent the animals from growing, and how to get rid of them.

ANS. -1. The best kinds of the late Mr. T. B. Miner's grapes were sent to us to be tested several years prior to his death. Of course, we have no right to dispose of roots or cuttings. Several of our nurserymen offer Miner's grapes for sale. Mrs. T. B. Miner, of Linden, N. J., could furnish them, no doubt. 2. "Black teeth" is not a disease, but a sign of ill-health, indigestion, sour stomach and acid secretions. The teeth will be all right when the pig is made right by right treatment. Give it one teaspoonful each of sulphur and carbonate of soda daily for a week and be careful not to over-feed; over-feeding is the prevalent bane of young pigs, which are crammed with food they cannot digest.

SHIP-STUFFS.

"Subscriber," Walesville, N. Y., asks how much better shipstuffs is than shorts for feeding cows, and whether eight quarts a day of either with hay would keep cows in full milk and prevent them from losing flesh after calving until grass comes in Spring.

ANS,—Shipstuffs is the generic name for bran, middlings and shorts, also called mill stuffs. Shorts is the next product of the grain to middlings and comes next to the flour in fineness. It contains the coarsest part of the flour and most of the inner coating of grain, and this consists largely of gluten. Shorts is not made in the new process of grinding, being nearly all contained in the No. 3 and No. 2 flour. Shorts alone would not be a good food for cows. If mixed with as much corn meal it would be an excellent food, and four to six quarts a day of the mixture would be ample to keep a cow in full milk.

Miscellaneous.

B. F. H., Galesburg, Ill, asks, 1, whether we have used the Mapes Special Potato Manure; 2, if so, do we think it the best that can be had for the price; 3, is its effect permanent; will it pay to use it on land rented for one year.

ANS.—1, Yes. 2. That we cannot state. Of all farm crops we know the least about potatoes and what is best for them. That is our experience after several years of right hard work with careful experiments. 3. We do not know. 4 That would depend upon the character of the soil and the season. Perhaps the soil does not need some of the kinds of plant food of which this potato fertilizer is composed. Really you can only ascertain by experiment. The effects of commercial fertilizers, however, are much less lasting than those of farm-yard manure.

S. B. P., Berien, Pa., asks for a remedy for worms in a horse. The pests are about five inches long and for half their length are almost as thick as a darning needle and for the other half as thin as a hair.

ANS.—This worm is known as Ascaris Megacephala and is a very common worm in the small intestines of the horse. The usual remedy is to give first a purgative, as four drachms of Barbadoes aloes, and after this has operated one pint of linseed oil with two onnces of turpentine, may be given every second day for eight days, and repeated after an interval of a week.

M. E. M. B., Cedar Mills, Minn., sends a "worm" for name.

ANS.—It is a centipede or myriapod. Dr. Leach assigns these to the class *myriopoda* and to the genus *scolopendra*. Professor Agassiz considered them the lowest order of the class of insects, the other orders comprising arachnids and insects proper. They generally avoid light and live under stones, under the bark of old trees, in old timber, etc. They are said to feed on both dead and living animal substances.

M. E. M. B., Cedar Mills, Minn., asks, 1, what area of land will be required for the Rural flint corn; 2, when should the RURAL wheat seeds be planted on the prairies of Minnesota. Fall-sown wheat thrives there only in very rare cases under very exceptional conditions.

ANS.—1. One-fortieth of an acre, *i. e.* thirty-three feet square. 2. We hope that in Spring-wheat sections they will be sown and tested as Spring wheats.

H. B., , Jonesville, Mich., asks whether the Rural Heavy Dent Corn is likely to mature there.

ANS.—We should think it would mature. Whichever sort gives the most satisfactory results there—flint or dent varieties—should be chosen.

J. V., Carthage, N. Y., not having planted the RURAL flower seeds last Spring, asks whether they will be likely to grow, if planted next Spring.

ANS.—Yes.

A. S., Fluvanna Co., Va., asks the price of Yellow-wood—Cladrastis tinctoria-and whether it is adapted to that latitude.

ANS.—Yes, it is well adapted to Virginia. The price at retail is about one dollar for each plant.

W. S., Walnut Ridge, Ark., asks the name of some reliable Southern nurseryman that propagates the Scuppernong Grape.

ANS.—P. J. Berckmans, Augusta, Ga.

David F. Hyre, Ripley, West Virginia, announces that he has about a gallon of the Rural Branching Sorghum seed that he will sell at a reasonable rate

DEDERICK'S HAY PRESSES

are sent anywhere on trial to operate against all other Presses, the customer keeping the one that suits best. No one has ever dared show up any other Press, as Dederick's Press is known to be beyond competition, and will bale with twice the rapidity of any other. The only way inferior machines can be sold is to deceive the inexperienced by ridiculously false statements, and thus sell without sight or seeing, and swindle the purchaser. Working any other Press alongside of Dederick's always sells the purchaser a Dederick Press, and all know it too well to show up. Address for circular and location of Western and Southern storehouses and Agents.

P. K. DEDERICK & CO., *Albany, N. Y.*

Our New Catalogue of the Planet Jr. Farm and Garden Implements is Free to all, and we guarantee it to interest every one who plants seeds or cultivates the soil. It is a beautiful descriptive work of 16 pages, full of illustrations. We want Market Gardeners and Root Growers to examine closely our fine Garden Tools: Farmers who value Labor-Saving Tools to study out our Combined Horse Hoe, Cultivator and Coverer; and every one who has even a small vegetable garden to learn what the Firefly Garden Plow will save them. S. L. ALLEN & CO. 127 and 129 Catharine St., Philadelphia, Pa.

CLARK'S IMPROVED ROOT CUTTER

PERFECTION OBTAINED IN Cutting Roots.

This Cutter has *received* the First Premium *at every Fair*, and has no *equal*. Do not fail to examine it.

The Neatest, Strongest, Simplest, Cheapest, and most Perfect Root Cutter in the Market.

This Cutter is built with a heavy oak frame, well bolted together; is staunch and strong, neatly finished, handsomely striped and ornamented. The cutting apparatus consists of *twenty-five Steel Knives*, (gouge-shaped), so arranged on a wrought-iron shaft that they are perfectly secure; no chance of becoming loose or breaking. The roots are neatly cut in pieces suitable for feeding. No coarse ungainly pieces are left by this Cutter. A boy can easily cut 35 to 40 bushels per hour, so easily does it do its work.

☞ Don't fail to examine it.

We are manufacturing three sizes, designated by numbers,—1, 2 and 3.

Nos. 1 and 2 designed for hand use.

No. 3 is the Power Cutter and will cut 100 bushels per hour.

PAPERS. 2,000 Periodicals at wholesale rates. Harper's Monthly, $3.10; N. Y. Tribune, 95c.; others at like low rates. 24-p. list free. Undoubted reference given. W. H. MOORE, Brockport, N. Y.

Miscellaneous.

MAKE HENS LAY.

An English Veterinary surgeon and Chemist, now traveling in this country, says that most of the Horse and Cattle Powders sold here are worthless trash. He says that Sheridan's Condition Powders are absolutely pure and immensely valuable. Nothing on earth will make hens lay like Sheridan's Condition Powders. Dose, one teaspoonful to one pint food. Sold everywhere, or sent by mail for eight letter stamps. I. S. JOHNSON & CO., Boston, Mass., formerly Bangor Me

ASTHMA *Quickly and Permanently* **CURED**

Dr. Stinson's Asthma Remedy is unequaled as a positive Alterative and Cure for Asthma and Dyspepsia, and all their attendant evils. It does not merely afford temporary relief, but is a permanent cure. Mrs. B. F. Lee, of Belmore, O., says of it: "*I am surprised at the speedy effects of your remedy. It is the first medicine in six years that has loosened my cough and made expectoration easy. I now sleep all night without coughing.*" If your druggist does not keep it, send for treatise and testimonials to H. P. K. PECK & CO., 853 Broadway, New York.

KIDNEY-WORT

THE GREAT CURE FOR RHEUMATISM

As it is for all diseases of the KIDNEYS, LIVER AND BOWELS.

It cleanses the system of the acrid poison that causes the dreadful suffering which only the victims of Rheumatism can realize.

THOUSANDS OF CASES of the worst forms of this terrible disease have been quickly relieved, in a short time PERFECTLY CURED.

KIDNEY-WORT

has had wonderful success, and an immense sale in every part of the Country. In hundreds of cases it has cured where all else had failed. It is mild, but efficient, CERTAIN IN ITS ACTION, but harmless in all cases.

☞ It cleanses, Strengthens and gives New Life to all the important organs of the body. The natural action of the Kidneys is restored. The Liver is cleansed of all disease, and the Bowels move freely and healthfully. In this way the worst diseases are eradicated from the system.

As it has been proved by thousands that

KIDNEY-WORT

is the most effectual remedy for cleansing the system of all morbid secretions. It should be used in every household as a

SPRING MEDICINE.

Always cures BILIOUSNESS, CONSTIPATION, PILES and all FEMALE Diseases.

Is put up in Dry Vegetable Form, in tin cans, one package of which makes 6 quarts medicine.

Also in Liquid Form, very Concentrated for the convenience of those who cannot readily prepare it. *It acts with equal efficiency in either form.*

GET IT OF YOUR DRUGGIST. PRICE, $1.00

WELLS, RICHARDSON & Co., Prop'rs, BURLINGTON, VT.

(Will send the dry post-paid.)

KIDNEY-WORT

Humorous.

JOHNNY went fishing the other day without consulting his parents. Next morning a neighbor's boy met him and asked, "Did you catc anything yesterday?" "Not till I got home,' was the rather sad and significant reply.

SPLENDIDLY CONSPICUOUS.—"Isn't it heavenly?" said Miss Sillybilly to Mr. Polo. "What!" he asked. "Why, the moon." "Oh, yes, just too utterly heavenly." "I do just dote on the moon, don't you?" "Yes, it's awful nice, isn't it? And so splendidly conspicuous, too."

"MA," she said, confidingly, "Henry has asked me to marry him." "And you accepted?" was the query. "No," was the reply, "I didn't, and neither did I reject him. If I keep him on the string until Christmas he'll make me a handsome present to induce me to say 'yes.' You know I've been wanting a gold watch for a long time."

GOING TO SCHOOL.
"The best of friends must part."

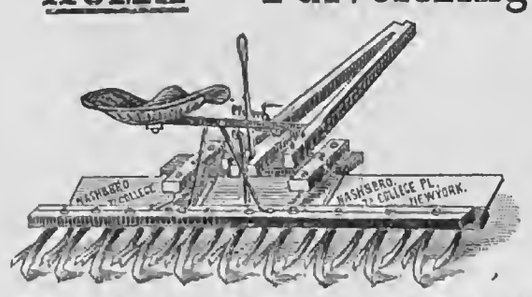
"ACME" Pulverizing



HARROW, CLOD CRUSHER AND LEVELER.

The "ACME" subjects the soil to the action of a **Crusher and Leveler**, and at the same time to the **Cutting, Lifting, Turning** process of double rows of **Steel Coulters**, the peculiar shape and arrangement of which give **immense cutting power. The entire absence of Spikes or Spring Teeth** avoids pulling up and scattering of rubbish. It is **especially adapted** to inverted sod, hard clay and "slough land" where other Harrows utterly fail, and also works perfectly on light soil.

Sent on trial to responsible farmers anywhere in the United States. Agents wanted. Send for circular.

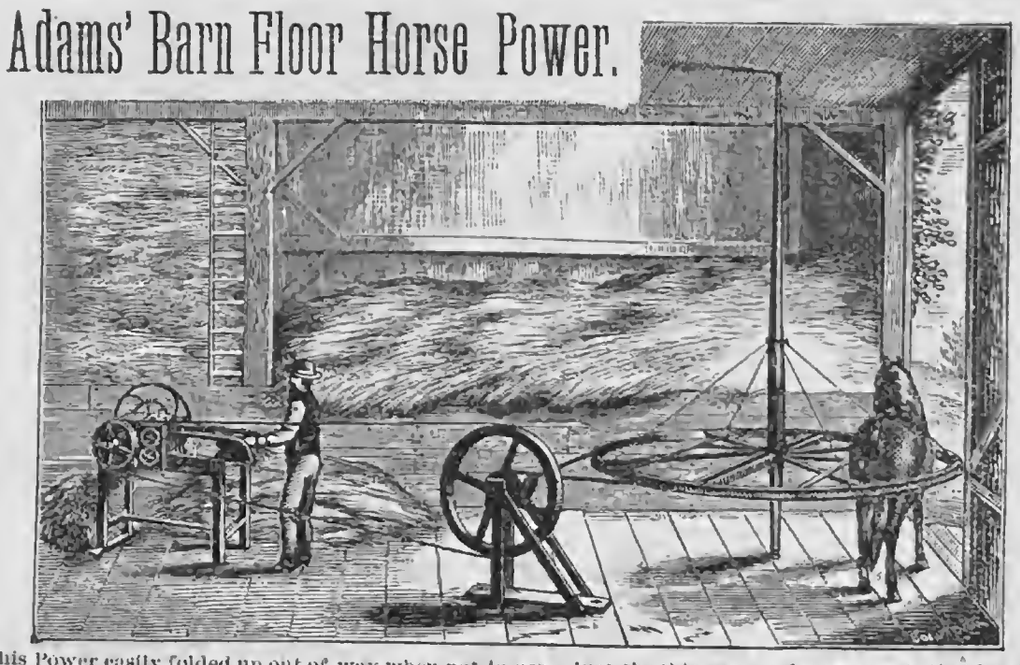
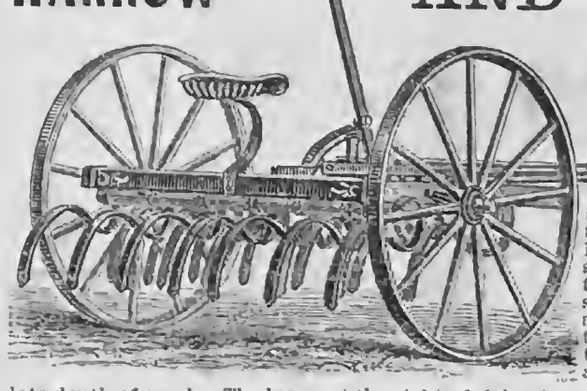
Adams' Barn Floor Horse Power.



This Power easily folded up out of way when not in use. Just the thing every farmer wants that has feed to cut, corn to shell, or anything 1 or 2 horses can do. Agents wanted. Send for circular. 2-horse, Power Jack Belt, and 18 feet flat Belt, $40. SMITH & WOODARD, Manufacturers, KALAMAZOO, MICH.

The Albion Spring Tooth Sulky
HARROW AND CULTIVATOR.



This celebrated Tool has been thoroughly introduced during the season of 1881, in the East and through the West, and hundreds of them have passed into the hands of Farmers, tried and purchased on their merit. This Tool, combined, is a perfect Harrow, a perfect field Cultivator, a perfect sulky Corn or Crop Cultivator; with its force feed Broadcast Seeder Attachment, sowing all kinds of Grain evenly. It is a perfect Seeder. The two sizes, No. 1 and No. 2 have Eighteen and Fifteen Teeth, made of the best spring steel, oil tempered, and are long and thin penetrating the hardest ground easily. The elasticity and spring of the teeth working through the soil imparts a yielding, vibratory motion, which instantly frees them from all obstructions. The frame is mounted two feet from the ground on wheels four feet high, and is adjusted by the axles up and down to regulate depth of work. The lever at the right of driver's seat controls the teeth instantly, regulating the depth and pitch of teeth, or elevating them for driving on road or for any purpose. This tool is strongly made and nicely finished, and will do more and better work than any other Harrow and Cultivator ever offered to Farmers.
Manufactured by ALBION M'F'G CO., Albion, Mich.

Is an elegant Book of 150 pages, a colored Frontis piece of Flowers, and more than 1000 Illustrations of the *choicest* Flowers, Plants and Vegetables and Directions for Growing. News of the Week.

HOME NEWS.

Saturday, Dec. 24, 1881.

Ex-Senator T. O. Howe, of Green Bay, Wis., was, on the 20th inst., appointed Postmaster-General in place of Thomas L. James. Mr. Howe, it will be remembered, was appointed early this year as one of the delegates to the Paris Monetary Conference.

Judge Horace Gray, of Massachusetts, has been nominated and confirmed Associate Justice of the Supreme Court.

Congress adjourned on the 21st until Jan. 5th. The President will pass the Christmas holidays in New York, and the members of the Cabinet will also visit their homes on that occasion.

Owing to the death of a wife of a juror the Guiteau trial was adjourned for two days. On the 21st inst., it was resumed again, Dr. Allan McLane Hamilton, of New York, and Dr. Worcester, of Salem, Mass., giving testimony that went against the theory of the defence. Guiteau's former wife was recalled to the witness-stand for a moment. The assassin apparently realized his growing danger of being hanged and threw the responsibility upon Mr. Scoville, whom he annoyed and humiliated by his abuse. He called his counsel a consummate idiot, said he had no sense and no wit, asserted that he was compromising the case, and ordered him to get out of it. He said: "If I were indicted for manslaughter, and Scoville defended me, I would be hanged for murder;" and "I expect that the Almighty, notwithstanding Scoville's asinine character, will see that I am protected."

Newark N. J., is getting its name up for high-toned embezzlements. A few weeks ago a bank cashier absconded with a large sum of money which he had "appropriated" and now comes Newark's City Auditor who confesses to the defalcation of about $125,000. Frederick A. Palmer is the man and his present address is the Erie County Jail.

The recent terrible disaster in a Vienna theater has set the authorities to thinking on the condition of theaters and their arrangements for exit in case of fire in this and other cities. The matter is being investigated by the personal inspection of officials of the Fire Department. The Mayor of Chicago and sub-committees of the Citizen's Association are also inspecting Chicago's theaters. A thorough investigation should be made by the proper authorities in every city.

Mr. Blaine has verbally accepted the invitation of the Joint Committee of the two Houses to deliver the oration at the Garfield Memorial service. The invitation can only be formally given by the action of both Houses, and no formal acceptance will be given until then.

They had a pretty close contest for Mayoralty in the election at Holyoke, Mass, recently. The Democratic candidate received 1,024 votes, and was elected by only three majority.

By the sudden opening of a drawbridge at Chicago on the 21st., a locomotive and tender plunged into the Chicago River. The conductor was crushed to death and the engineer had one of his lower limbs cut off.

The counsel of Sergeant Mason, who shot at Guiteau, states that he is ready and anxious for trial, and is awaiting the action of General Hancock. The defence is insanity.

The Hudson River is free from ice as far north as Albany. Last year at this time it was filled with heavy masses of ice from shore to shore.

A box weighing 96 pounds was recently received at the Post Office at Galveston, Texas. It was addressed to the postmaster at that place, with a letter requesting him to deliver it to a person in Galveston. There was only a nominal amount of stamps affixed, and the proper postage would be over $90.

A body of masked men, calling themselves "Regulators," or "Knights of the Switch," have been going about Corydon, Ind., at night switching such persons as they deemed deserving of correction. They have operated in Harrison County. A few nights ago they whipped severely a Mr. Borden, and on the following night returned to his house and took out his step-daughter, nineteen years old. Putting a rope around her neck, they led her to a tree and demanded that she should reveal certain secrets which they declared she knew. She refused, and they hanged her by the neck twice, until she was nearly dead. Not succeeding in getting a confession, they rode away and left her. The outrage excites deep indignation.

Another theater is burned, the Grand Opera House of Columbus, O. It took fire, probably, soon after midnight on the 16th from a furnace beneath the entrance door. A few hours earlier the theatre was crowded. Apparently here was a narrow escape from a panic, if not a disaster of the Brooklyn and Vienna sort.

The Mexican Kickapoos, semi-civilized Indians in the Indian Territory, are on the point of starvation through the failure of crops and the disappearance of game.

Mr. J. C. Bancroft Davis, one of the most experienced and able of our few trained diplomatists, is to be Assistant Secretary of State. Mr. Davis began his career in diplomacy very early in life as Secretary of Legation in London, where he served from 1849 to 1852. He became Assistant Secretary of State in 1869, when Mr. Fish took control of the State Department.

It is reported on good authority that the review of the Whittaker case confirms the former decision and finds him guilty of self mutilation.

Our readers may be interested to know how the new Cabinet and the old compare:

	Under Pres. Garfield.	*Under Pres. Arthur.*
Sec. of State.	J. G. Blaine,	T. F. Frelinghuysen.
Sec. of Treas.	Wm. Windom.	Charles J. Folger,
Sec. of War.	Robt. T. Lincoln.	Robt. T. Lincoln.
Sec. of Navy.	Wm. H. Hunt.	Wm. H. Hunt.
Sec. of Int.	S. J. Kirkwood.	S. J. Kirkwood.
Post'r Gen.	Thos. James.	Timothy O. Howe,
Att'y-Gen.	Wayne MacVeagh.	Benj. H. Brewster.

The three remaining nominations to fill Lincoln's, Hunt's and Kirkwood's places will probably be made soon after the holidays.

Red Bank, N. J., was visited by a conflagration last night which swept through the business portion of the town and destroyed a large amount of property. The loss, so far as could be ascertained, will reach nearly $100,000.

Half a million emigrants are said to be already booked by the steamship agents for passage to this country next year.

Stewart, the notorious train robber, incendiary and bank robber, has been arrested at Houston, Texas. It is said that he robbed a Chicago and Alton train of $10,000. Detectives have been looking for Stewart for seven years. He has been taken to Kansas City, where ten indictments stand against him.

Mayor Carleton, Chairman of the Port Huron Executive Committee, estimates that $200,000 are needed for the Michigan sufferers by the fire last Fall.
